(54) Title: USE OF Stat 6 SH2 DOMAIN SPECIFIC COMPOUNDS TO TREAT ALLERGIC REACTIONS

(57) Abstract

Invented is a method of treating allergic reactions in a subject which comprises administering to the subject a therapeutically effective amount of a compound which binds to a human Stat 6 SH2 domain with a binding affinity greater than fifty-fold higher than the binding affinity with which the compound binds to a human Stat 5 SH2 domain, binds to a human hcp SH2 domain, a human Grb2 SH2 domain, a human SH-PTP2 SH2 domain and a human p85 SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain, and binds to a human src SH2 domain, a human lck SH2 domain and a human fyn SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain.

USE OF Stat 6 SH2 DOMAIN SPECIFIC COMPOUNDS TO TREAT ALLERGIC
REACTIONS

BACKGROUND OF THE INVENTION

5 A number of polypeptide growth factors and hormones mediate their cellular effects through a signal transduction pathway. Transduction of signals from the cell surface receptors for these ligands to intracellular effectors frequently involves phosphorylation or dephosphorylation of specific protein substrates by regulatory protein tyrosine kinases (PTK) and phosphatases. Tyrosine phosphorylation may be
10 the primary, or possibly even the sole, indicator of signal transduction in multicellular organisms. Receptor-bound and intracellular PTKs regulate cell proliferation, cell differentiation and signalling processes in immune system cells.

15 Aberrant protein tyrosine kinase activity has been implicated or is suspected in a number of pathologies such as diabetes, atherosclerosis, psoriasis, septic shock, bone loss, anemia, many cancers and other proliferative diseases. Accordingly, tyrosine kinases and the signal transduction pathways which they are part of are potential targets for drug design. For a review, see Levitzki et al. in Science 267, 1782-1788 (1995).

20 Many of the proteins comprising signal transduction pathways are present at low levels and often have opposing activities. The properties of these signalling molecules allow the cell to control transduction by means of the subcellular location and juxtaposition of effectors as well as by balancing activation with repression such that a small change in one pathway can achieve a switching effect.

25 The formation of transducing complexes by juxtaposition of the signalling molecules through protein-protein interactions are mediated by specific docking domain sequence motifs. Src homology 2 (SH2) domains, which are conserved non-catalytic sequences of approximately 100 amino acids found in a variety of signalling molecules such as non-receptor PTKs and kinase target effector molecules and in oncogenic proteins, play a critical role. The SH2 domains are highly specific
30 for short phosphotyrosine-containing peptide sequences found in autophosphorylated PTK receptors or intracellular tyrosine kinases.

Approximately 60 proteins having distinct catalytic or other functional domains yet sharing conserved SH2 domains, conserved sequences of approximately 100 amino acids, have been identified. It is not known precisely which physiological responses in the body are controlled by each of these SH2 domains.

5 Further, the SH2 domain-ligand/compound interactions are highly specific such that minor modifications in the structure of the ligand/compound will significantly alter the selectivity with which the ligand/compound binds to the various SH2 domains.

The Stat (signal transduction and activation of transcription) proteins are SH2 containing intracellular proteins that transmit a signal from cytokine receptors 10 to the nucleus and activate transcription of specific target genes (Darnell J. et al., Science **264**, 1415-1421 (1994)). These proteins are recruited to phosphorylation sites on the receptor via their SH2 domains and are themselves phosphorylated on tyrosine residues by receptor-associated Janus (JAK) tyrosine kinases. Phosphorylation of Stat tyrosine residues provides additional binding ligands for the 15 Stat SH2 domains which are displaced from the receptor and bind to the Stat phosphotyrosine motifs forming dimers. The dimeric Stats translocate to the nucleus where they bind to DNA and to other accessory proteins and activate transcription of target genes. Individual Stats or Stat heterodimers transduce signals from different cytokine receptors, for example, Stat 6 mediates interleukin 4 20 signalling while Stat 5 transduces signals from the erythropoietin (EPO) receptor (Hou J. et al., Science **265**, 1701-1706 (1994); Penta K. et al., J. Biol. Chem. **270**, 31282-31287 (1995)).

In disease states involving dysregulation of cytokine activity, compounds that activate or inhibit Stat proteins would be useful therapeutic agents. For 25 example, inhibition of Stat 6 would block IL-4 and IL-13-mediated up-regulation of the IgE receptor (Izuhara K. et al., J. Biol. Chem. **271**, 619-22 (1996)) and be useful in the treatment of allergic reactions. Conversely, activation of Stat 5 would mimic the effects of EPO and alleviate anemia. The SH2 domain of Stat proteins provides a means to activate or inhibit their function. Activation can be achieved by inducing 30 dimer formation by means of a dyad-symmetric ligand for the relevant SH2 domain, while a monomeric ligand would inhibit Stat function. Discovery of such ligands

requires targeting of the SH2 domains of specific Stat proteins to induce or inhibit the desired homo- or heterodimer formation.

The consequences of non selective binding SH2 domains can be quite severe. For example, the Stat 6 SH2 domain and the Stat 5 SH2 domain are structurally similar, possessing a high degree of conservation between the domains. Antagonism of the Stat 6 SH2 domain (discussed herein) is indicated as treating allergic reactions while activation of the Stat 5 SH2 domain is indicated as increasing red blood cell production. Therefore, an activator of Stat 5 with Stat 6 cross-reactivity would exacerbate allergic reactions, whereas a Stat 6 inhibitor cross-reacting with Stat 5 would inhibit erythrocyte production.

Furthermore, it would be impractical to assay potential Stat 6 SH2 domain antagonists in binding studies against all 60 known SH2 domains. Presently, there are no known compounds which selectively interact with the Stat 6 SH2 domain.

It would be desirable to provide methods and compounds which allow the treatment of allergic reactions by antagonizing the Stat 6 SH2 domain but which avoid the production of side effects observed in non-selective SH2 domain interaction.

As disclosed herein it has unexpectedly been discovered that selective Stat 6 SH2 domain antagonists can be identified by binding assays against the subset of SH2 domains consisting of; the src SH2 domain, the Stat 6 SH2 domain, the lck SH2 domain, the Stat 5 SH2 domain, the fyn SH2 domain, the SHPTP2 SH2 domain, the p85 domain, the Grb2 SH2 domain and the hcp SH2 domain.

From the information described hereinafter, it has unexpectedly been discovered that compounds which are specific for a human Stat 6 SH2 domain with a binding affinity greater than fifty-fold higher than the binding affinity with which the compound binds to a human Stat 5 SH2 domain, (b) binds to a human hcp SH2 domain, a human Grb2 SH2 domain, a human p85 SH2 domain and a human SH-PTP2 SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain, and (c) binds to a human src SH2 domain, a human lck SH2 domain and a human fyn SH2 domain with a binding affinity which is greater than fifty-fold lower than the

binding affinity with which the compound binds to such Stat 6 SH2 domain are effective for treating allergic reactions.

SUMMARY OF THE INVENTION

5 The present invention provides a method of treating allergic reactions in a subject which comprises administering to the subject a therapeutically effective amount of a compound which (a) binds to a human Stat 6 SH2 domain with a binding affinity greater than fifty-fold higher than the binding affinity with which the compound binds to a human Stat 5 SH2 domain, (b) binds to a human hcp SH2
10 domain, a human Grb2 SH2 domain, a human SH-PTP2 SH2 domain and a human p85 SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain, and (c) binds to a human src SH2 domain, a human lck SH2 domain and a human fyn SH2 domain with a binding affinity which is greater than fifty-fold lower than the
15 binding affinity with which the compound binds to such Stat 6 SH2 domain.

DETAILED DESCRIPTION OF THE INVENTION

As used herein, the term "allergic reaction" means any adverse physical reaction which is exacerbated or caused by IL-4, IL-13 or both IL-4 and IL-13
20 mediated up-regulation of the IgE receptor.

Preferred allergic reactions which are treated according to the present invention are asthma, allergic asthma, allergic rhinitis and atopic dermatitis.

Particularly preferred allergic reactions which are treated according to the present invention are allergic asthma and allergic rhinitis.

25 As used herein, the term "treating" and derivatives thereof means prophylactic or therapeutic therapy.

As used herein, the term "compound" means a nonpeptide chemical compound.

As used herein, unless otherwise defined, the term "Stat 6 SH2 domain
30 antagonists" means a compound which (a) binds to a human Stat 6 SH2 domain with a binding affinity greater than fifty-fold higher, preferably greater than one hundred-

fold higher, than the binding affinity with which the compound binds to a human Stat 5 SH2 domain, (b) binds to a human hcp SH2 domain, a human Grb2 SH2 domain, a human SH-PTP2 SH2 domain and a human p85 SH2 domain with a binding affinity which is greater than fifty-fold lower, preferably greater than one
5 hundred-fold lower, than the binding affinity with which the compound binds to such Stat 6 SH2 domain, and (c) binds to a human src SH2 domain, a human lck SH2 domain and a human fyn SH2 domain with a binding affinity which is greater than fifty-fold lower, preferably greater than one hundred-fold lower, than the binding affinity with which the compound binds to such Stat 6 SH2 domain.

10 The present invention provides a method of treating allergic reactions in a subject which comprises administering to the subject a therapeutically effective amount of a compound which (a) binds to a human Stat 6 SH2 domain with a binding affinity greater than fifty-fold higher than the binding affinity with which the compound binds to a human Stat 5 SH2 domain, (b) binds to a human hcp SH2 domain, a human Grb2 SH2 domain, a human SH-PTP2 SH2 domain and a human p85 SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain, and
15 (c) binds to a human src SH2 domain, a human lck SH2 domain and a human fyn SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain.
20

A preferred aspect of the invention provides a method of treating allergic reactions in a subject which comprises administering to the subject a therapeutically effective amount of a compound which (a) binds to a human Stat 6 SH2 domain with a binding affinity greater than fifty-fold higher than the binding affinity with which
25 the compound binds to a human Stat 5 SH2 domain.

A preferred aspect of the invention provides a method of treating allergic reactions in a subject which comprises administering to the subject a therapeutically effective amount of a compound which (a) binds to a human Stat 6 SH2 domain with a binding affinity greater than one hundred-fold higher than the binding affinity with
30 which the compound binds to a human Stat 5 SH2 domain, (b) binds to a human hcp SH2 domain, a human Grb2 SH2 domain, a human SH-PTP2 SH2 domain and a

human p85 SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain, and (c) binds to a human src SH2 domain, a human lck SH2 domain and a human fyn SH2 domain with a binding affinity which is greater than one
5 hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain.

A preferred aspect of the invention provides a method of treating allergic reactions in a subject which comprises administering to the subject a therapeutically effective amount of a compound which (a) binds to a human Stat 6 SH2 domain with
10 a binding affinity greater than one hundred-fold higher than the binding affinity with which the compound binds to a human Stat 5 SH2 domain.

The inhibitory activity of compounds at the different human SH2 domains is determined *in vitro* using SH2 domains expressed as fusion proteins either in *E. coli* or in baculovirus as further described in detail in Example 11 below.

15 The data shown in the accompanying Tables 1 and 2 indicate the ability of the stated compounds to antagonize various SH2 domains. Compounds indicated as selective Stat 6 SH2 domain antagonist from assays as demonstrated in Example 11 are tested in known assays for there ability to treat allergic reactions. Preferred assays include:

20 1) Carballido et al., Int. Arch. Allergy Immunol. 107: (1995) 304-307,
2) Pestel et al., J. Immunol. 153: (1994) 3804, and
3) Kilchherr et al., (1993) Cell. Immunol. 151: (1993) 241-256.

Activity in these assays is recognized in the art as correlating with efficacy in treating allergic reactions *in vivo*. Activity in these assays is also recognized in the
25 art as correlating with efficacy in treating asthma *in vivo*. Activity in these assays is also recognized in the art as correlating with efficacy in treating allergic asthma *in vivo*. Activity in these assays is also recognized in the art as correlating with efficacy in treating allergic rhinitis *in vivo*. Activity in these assays is also recognized in the art as correlating with efficacy in treating atopic dermatitis *in vivo*.

30 The present invention therefore provides a method of treating allergic reactions, which comprises administering a quantity of a Stat 6 SH2 domain

antagonists defined as herein in a quantity effective to treat allergic reactions. The drug may be administered to a patient in need of treatment for allergies by any conventional route of administration, including, but not limited to, intravenous, intramuscular, oral, subcutaneous, intradermal, and parenteral. The quantity effective to induce immunosuppression is from about 0.001 mg per kg to about 10.0 mg per kg of subject body weight. The selected dose will be an efficacious, nontoxic quantity selected from about 0.001 mg per kg to about 10.0 mg per kg of subject body weight. The selected dose will be administered from about 1-6 times daily.

10 The method of treating allergic reactions disclosed in the present invention may also be carried out using a pharmaceutical composition comprising a Stat 6 SH2 domain antagonists defined herein and a pharmaceutically acceptable carrier. The composition may contain between 0.05 mg and 500 mg of a Stat 6 SH2 domain antagonist, and may be constituted into any form suitable for the mode of administration selected. Compositions suitable for oral administration include solid forms, such as pills, capsules, granules, tablets, and powders, and liquid forms, such as solutions, syrups, elixers, and suspensions. Forms useful for parenteral administration include sterile solutions, emulsions, and suspensions.

15 The drug may otherwise be prepared as a sterile solid composition which may be dissolved or suspended at the time of administration using sterile water, saline, or other appropriate sterile injectable medium. Carriers are intended to include necessary and inert binders, suspending agents, lubricants, flavorants, sweeteners, preservatives, dyes and coatings.

20 Optimal dosages to be administered may be readily determined by those skilled in the art, and will vary with the particular Stat 6 SH2 domain antagonist in use, the strength of the preparation, the mode of administration, and the advancement of the disease condition. Additional factors depending on the particular patient being treated will result in a need to adjust dosages, including patient age, weight, diet, and time of administration.

25 The invention also provides for the use of a Stat 6 SH2 domain antagonists in the manufacture of a medicament for use in treating allergic reactions.

The invention also provides for a pharmaceutical composition for use in the treatment of allergic reactions which comprises a Stat 6 SH2 domain antagonists.

No unacceptable toxicological effects are expected when the methods of the invention are utilized in accordance with the present invention.

5 Without further elaboration, it is believed that one skilled in the art can, using the preceding description, utilize the present invention to its fullest extent. The following Examples are, therefore, to be construed as merely illustrative and not a limitation of the scope of the present invention in any way.

10

Experimental Details

As used herein, unless otherwise indicated, the symbol ° means °C.

L-3,5-Dibromotyrosine can be prepared by methods known in the art, for example as described in "Thyroid Hormones and Analogues. I. Synthesis, Physical Properties and Theoretical Calculations" E. C. Jorgensen, Hormonal Proteins and Peptides, Vol. VI, 1978, Academic Press, N.Y. and references cited therein.

L-3,5-dibromo-N-trifluoroacetyl-tyrosine methyl ester (for use in Example 2 (e) and in Example 2B (b)) can be prepared according to the following procedure.

L-3,5-Dibromotyrosine (500 g) was suspended in methanol (5 liters) and dry hydrogen chloride passed through the stirred suspension for 5 hours. The reaction mixture was evaporated to dryness, the residue suspended in water (4 liters), and the pH adjusted to 6 with 40% sodium hydroxide. The precipitate was collected and washed with water to give L-3,5-dibromotyrosine methyl ester (467 g, 90%), m.p. 201°-203°. The ester (768 g) was suspended in chloroform (2.7 liters) and ethyl acetate (2.7 liters), then trifluoroacetic anhydride (565 g) was added over 0.5 hour, keeping the temperature below 35°. The mixture was left overnight, then water (2 liters) was added and the pH adjusted to 7 by the addition of saturated sodium bicarbonate solution. The organic layer was removed, washed with water, dried with anhydrous magnesium sulphate and evaporated. The residue was recrystallised from aqueous methanol to give L-3,5-dibromo-N-trifluoroacetyl-tyrosine methyl ester (786 g, 81%), m.p. 136°-7°.

Scheme 1 as used in Example 6 below

5

The amino group of 4-trans-aminomethyl-cyclohexyl-carboxylic acid 1 is protected with a standard protective group such as with a Boc group (Boc anhydride, NaOH, H₂O, dioxane) to form 2, then is coupled to Kaiser oxime resin (Kaiser, E.T.; et al *J Am Chem Soc* 1985, 107, 7087-7092) using a coupling reagent such as DCC to form 3. The amine is then deprotected under standard conditions (25% TFA, methylene chloride) to form 4, then is acylated with standard conditions (such as with HBTU, NMM in DMF or DCC or DIC in DMF or NMP) to form 5. The compound is then cleaved from the resin with various amines to form the final desired product 6.

10

15 Compounds 1 to 10 are prepared according to Examples 1 to 10 which follow.

Example 1

20

Preparation of 7-[D,L- α -Amino- α -(4-carboxyphenyl)acetamido]-3-[2-(5-methyl-1,3,4-thiadiazolyl)thiomethyl] Δ^1 -cephem-4-carboxylic Acid (Compound 1)

25 a) 4-Hydroxymethylbenzaldehyde

To a solution of 1,4-benzenedicarboxaldehyde (50.0 g, 0.373 mole) in dry

tetrahydrofuran (200 mL) under nitrogen in an ice bath was added dropwise lithium tri(tert-butoxy)aluminum hydride (104.0 g, 0.410 mole) in 500 mL of tetrahydrofuran. After stirring for one half hour in an ice bath, the reaction mixture was poured into 2 L of ice cold 2 N hydrochloric acid. The aqueous solution was

5 extracted with four 800 mL portions of ether. The combined ether layers were washed with sodium bicarbonate solution, brine and dried. Evaporation of the solvent afforded 46 g of crude material that was purified by chromatography (alumina, ether elution) to provide the title compound as a crystalline material (17.6 g, 35%): mp 44.5-46 °C

10

b) 5-(4-Hydroxymethylphenyl)hydantoin

To a stirred mixture of 4-hydroxymethylbenzaldehyde (10.0 g, 73.5 mmol) and ammonium carbonate (17.1 g, 150 mmol) in 110 mL of 60% aqueous ethanol heated to 50 °C there was added sodium cyanide (4.0 g, 81 mmol) in 10 mL of water. The mixture was stirred and heated at 50-60 °C for 3 h and then at 85 °C for one hour. After cooling in an ice bath, the pH of the solution was adjusted to 6 by addition of concentrated hydrochloric acid. Upon overnight cooling, the solid which had precipitated was filtered, washed with water and dried to provide the title compound (11.0 g, 72%): mp 189-196 °C.

20

c) 4-Hydroxymethylphenylglycine

A mixture of compound of Example 1(b) (10.9 g, 53 mmol) and barium hydroxide octahydrate (25.5 g, 81 mmol) in 125 mL of water was stirred under reflux for 18 h. The reaction mixture was cooled and acidified to pH 1 with concentrated sulfuric acid; the barium sulfate was filtered and the pH of the filtrate brought to 6 with lead carbonate. After filtration of the lead sulfate, the filtrate was saturated with hydrogen sulfide and the lead sulfide filtered. The aqueous solution was then concentrated to 100 mL by azeotroping with ethanol under reduced pressure to provide, after cooling, the title compound (5.2 g, 54%): mp 230-231 °C.

25

d) N-*tert*-Butoxycarbonyl-4-hydroxymethylphenylglycine

To a solution of 4-hydroxymethylphenylglycine (8.0 g, 44 mmol) and triethylamine (8.8 g, 87 mmol) in 160 mL of water was added *tert*-butoxycarbonyl azide (6.95 g, 49 mmol) in 120 mL of tetrahydrofuran. After stirring overnight at room temperature, the reaction mixture was washed twice with 200 mL portions of ether. The aqueous layer was covered with ether and acidified to pH 3-3.5 with 3 N hydrochloric acid in an ice bath. The acidic solution was extracted with ether and

the combined organic extracts washed with brine, dried and evaporated. The resulting oil was triturated with chloroform-hexane and the solid filtered off to provide the title compound (7.7 g, 63%): mp 139-141.5 °C.

5) N-*tert*-Butoxycarbonyl-4-hydroxymethyphenylglycine Methyl Ester

To a solution of compound of Example 1(e) (5.6 g, 20 mmol) was added dimethyl sulfate (3.1 g, 24 mmol) and diisopropyl amine (5.2 g, 40 mmol) in methanol (10 mL). The mixture was refluxed for 20 min and was then treated with 2 N aqueous hydrochloric acid. The aqueous solutin was extracted with ethyl acetate three times and the combined organic extracts washed with 5% aqueous sodium bicarbonate and brine. Evaporation of the solvent provided the title compound as an oil (3.2 g, 55%).

10 f) N-*tert*-Butoxycarbonyl-4-carboxyphenylglycine Methyl Ester

A solution of the compound of Example 1(e) (0.62 g, 2.1 mmol) in 50 ml of acetone was treated with excess Jones reagent (8N chromic acid) at 25° C. The reaction mixture was stirred at room temperature for 2 hours. The green solid was filtered off and excess CrO₃ was decomposed by isopropyl alcohol. The filtrate was dried over anhydrous sodium sulfate and treated with activated charcoal. Solid was filtered off and the filtrate was evaporated to dryness to yield 0.38 g of title

20 compound as white solid: mp 126-128 °C.

g) 1,1-Dimethylethyl N,N'-Bis(1-methylethyl)carbamimidate

The title compound was prepared by reaction of neat N,N'-diisopropylcarbodiimide (1.0 equiv) with 2-methyl-2-propanol (1.15 equiv) in the presence of CuCl (0.01 equiv) for 1 day at room temperature, according to the procedure of Santini et al. (*J. Org. Chem.* 1994, 59, 2261).

h) N-*tert*-Butoxycarbonyl-4-(*tert*-butoxycarbonyl)phenylglycine Methyl Ester

A solution of the compound of Example 1(f) (1.0 g, 3.2 mmol) and 1,1-dimethylethyl N,N'-bis(1-methylethyl)carbamimidate (1.3 mg, 6.5 mmol) of in dry dichloromethane was stirred at room temperature over night. Di-isopropylurea was filtered off and the excess 1,1-dimethylethyl N,N'-bis(1-methylethyl)carbamimidate was decomposed with water. Layers were separated and the dichloromethane solution was washed with 5% aqueous sodium bicarbonate and brine and dried over anhydrous sodium sulfate. Solvent was evaporated off and the residue was treated with diethyl ether. Additional di-isopropylurea was filtered off and the organic filtrate was evaporated to yield the title compound as an oil (870 mg, 74%).

i) N-*tert*-Butoxycarbonyl-4-(*tert*-butoxycarbonyl)phenylglycine

A solution of the compound of Example 1(h) (760 mg, 2.1 mmol) in 18 mL of 5% aqueous sodium bicarbonate, 18 mL of 5% aqueous sodium carbonate and 36 mL of methanol was stirred overnight at room temperature for 5 hours. The reaction mixture was diluted with water, washed with ethyl acetate and the aqueous solution was covered with fresh ethyl acetate and acidified to pH 2 with 3N HCl. Layers were separated and the aqueous solution was extracted with ethyl acetate 2 more times. Ethyl acetate solutions were dried over anhydrous sodium sulfate and evaporated to yield title compound as a white solid (600 mg, 82%): mp 77-79 °C.

j) *tert*-Butyl 7-Amino-3-[2-(5-methyl-1,3,4-thiadiazolyl)thiomethyl] Δ^3 -cephem-4-carboxylate.

A solution of *tert*-butyl 7-aminocephalosporanate (prepared from 7-aminocephalosporanic acid by reaction with isobutylene and sulfuric acid in 1,2-dimethoxyethane, according to the procedure of Blacklock et al., *J. Org. Chem.* 1989, 54, 3907), sodium bicarbonate and 2-mercapto-5-methyl-1,3,4-thiadiazole in phosphate buffer (pH 6.4) is stirred for 6 h at 60 °C. The reaction mixture is worked up by extraction with aqueous hydrochloric acid/ethyl acetate to provide the title compound.

k) *tert*-Butyl 7-[D,L- α -(*tert*-Butoxycarbonylamino)- α -(*tert*-butoxycarbonyl)phenyl]acetamido-3-[2-(5-methyl-1,3,4-thiadiazolyl)thiomethyl] Δ^3 -cephem-4-carboxylate

A mixture of N-*tert*-butoxycarbonyl-4-(*tert*-butoxycarbonyl)phenylglycine of Example 1(i) (351 mg, 1 mmol), *tert*-butyl 7-amino-3-[2-(5-methyl-1,3,4-thiadiazolyl)thiomethyl] Δ^3 -cephem-4-carboxylate of Example 1(j) (368 mg, 1 mmol) and DCC (212 mg, 1 mmol) in dry dichloromethane was stirred at room temperature for 3 hours. The dicyclohexylurea was filtered off and the filtrate was evaporated to dryness. The residue was dissolved in ethyl acetate and the ethyl acetate solution was washed with 5% aqueous sodium bicarbonate, 2.5% sulfuric acid, 5% aqueous sodium bicarbonate, brine and dried over anhydrous sodium sulfate. The solvent was evaporated to yield 0.6 g of crude product. Purification by silica gel chromatography (elution with 30:70 ethyl acetate / benzene) provided the title compound (430 mg, 61%): mp 110-112 °C.

I) 7-[D,L- α -Amino- α -(4-carboxyphenyl)acetamido]-3-[2-(5-methyl-1,3,4-thiadiazolyl)thiomethyl] Δ^3 -cephem-4-carboxylic Acid

A solution of the compound of Example 1(k) (400 mg, 0.57 mmol) was stirred in 7.2 mL of trifluoroacetic acid and 0.8 mL of thiophenol. The reaction mixture was stirred at 0 °C for 30 minutes and at room temperature for 1 hour. The solvents were evaporated off in a 40° C water bath and the residue was triturated with diethyl ether three times; the solid product was dissolved in small amounts of methanol and the product was precipitated by addition of diethyl ether to afford the title compound (300 mg): mp 170-175 °C.

10

Example 2

Preparation of L-3,5-Dibromo-3'-(6-oxo-3(1H)-pyridazinylmethyl)-thyronine
(Compound 2)

15

(a) o-Methoxyphenylacetonitrile (23.64 g) and 3,6-dichloropyridazine (23.93 g) were dissolved in dry dimethylformamide (50 ml) and sodium hydride (16.23 g of a 50% dispersion in oil) was slowly added in portions to the stirred solution over 2 hours. The mixture was poured on to excess crushed ice and extracted with dichloromethane. The organic layer was removed and washed with water, dried with anhydrous magnesium sulphate, charcoaled and evaporated to dryness. The residue crystallised from dichloromethane/petroleum spirit to give 1-(6-chloro-3-pyridazinyl)-1-(2-methoxyphenyl)-acetonitrile (35.5 g 85%), m.p. 91°-92°.

(b) This nitrile (33.5 g) was dissolved in concentrated hydrochloric acid (200 ml), acetic acid (100 ml) and water (100 ml) and the solution refluxed with stirring. After 6 hours the solvents were evaporated and the residue recrystallised

from ethyl acetate/petroleum spirit to give 2-(6-oxo-3(1H)-pyridazinylmethyl)-anisole (21.4 g, 77%), m.p. 142°-3°.

(c) This pyridazinone (15.7 g) was dissolved in phosphorous oxychloride (22 ml) and the solution heated with stirring at 55° (oil bath) for 1 hour. The cooled 5 mixture was slowly poured onto crushed ice, and extracted with dichloromethane. The organic layer was separated and washed with saturated sodium bicarbonate solution, dried with anhydrous magnesium sulphate and evaporated. The residue was combined with a smaller batch (from 2.16 g of the pyridazinone) and extracted several times with boiling petroleum spirit (60°-80°). The combined extracts were 10 charcoaled and evaporated to give 2-(6-chloro-3-pyridazinylmethyl)-anisole (16.95 g, 87%), m.p. 63°.

(d) To a stirred suspension of iodine tristrifluoroacetate (prepared by treatment of iodine (2.54 g) with fuming nitric acid (5 ml) in acetic anhydride and trifluoroacetic acid) in trifluoroacetic anhydride (25 ml) at -15° was added the above 15 chloropyridazine (9.39 g) in trifluoroacetic acid (20 ml) and trifluoroacetic anhydride (25 ml), keeping the temperature below -15°. The mixture was stirred at room temperature overnight, concentrated, then a solution of sodium acetate (25 g) and sodium perchlorate (15 g) in water (200 ml) was added. The mixture was extracted with chloroform, the organic solution dried with anhydrous magnesium sulphate, then concentrated to 50 ml and poured into stirred ether (250 ml). The precipitate was collected and dried to give crude 4,4'-dimethoxy-3,3'-bis-(6-chloro-3-pyridazinyl-methyl)-diphenyl iodonium perchlorate (14 g). ^1H NMR δ (DMSO-d₆) 3.80 (3H, s, —OCH₃), 4.20 (2H, s, —CH₂Ar), 7.05 (1H, m, Ar-5H), 7.65 (2H, m, PyH) and 8.00 (2H, m, Ar-2,6H).

(e) The above iodonium salt (12.45 g), L-3,5-dibromo-N-trifluoroacetyl tyrosine methyl ester (8.98 g), triethylamine (4.05 g) and copper bronze (1.0 g) were stirred in dichloromethane (50 ml) for 18 hours. The mixture was filtered, washed with aqueous acetic acid, 2N sodium hydroxide, then water, then dried with anhydrous magnesium sulphate and evaporated. The residue was combined with a 25 smaller batch (from 0.72 g of the iodonium salt) and purified by column chromatography on silica gel (400 g). Elution with ethyl acetate/petroleum spirit (60°-80°) [1:3] gave L-3,5-dibromo-3'-(6-chloro-3-pyridazinylmethyl)-O-methyl-N-trifluoroacetyl-1-thyronine methyl ester (4.0 g) as a tan coloured froth. ^1H NMR δ (CDCl₃) 3.06 (2H, m, ArCH₂CH), 3.84 and 3.93 (6H, 2s, —OCH₃), 4.19 (2H, s, ArCH₂Py), 4.75 (1H, m, ArCH₂CH), 6.62 (3H, m, ArH), 7.17 (2H, m, PyH) and 7.23 (2H, s, ArH).

(f) The above dibromo compound (3.27 g) was dissolved in acetic acid (20 ml) containing sodium acetate (0.79 g). The solution was refluxed for 1.25 hours, sufficient water (approximately 2 ml) added to dissolve the precipitated sodium chloride, and the solution evaporated to dryness. The residue was 5 partitioned between water and ethyl acetate, the organic layer removed and washed with saturated sodium bicarbonate, then dried with anhydrous magnesium sulphate and evaporated to dryness. The residue was crystallised from ethyl acetate/petroleum spirit (60°-80°) to give L-3,5-dibromo-O-methyl-3'-(6-oxo-3(1H)-pyridazinylmethyl)-N-trifluoro-

10 acetylthyronine methyl ester (2.52 g, 79%), m.p. 176°-8°.

(g) This pyridazinone (2.45 g) was dissolved in dry dichloromethane (40 ml) and cooled with stirring at 0°. Boron tribromide (6.46 g) in dichloromethane (3 ml) was added. A red-brown precipitate formed. The mixture was stirred at room temperature for 1.5 hours, then crushed ice was added. The mixture was filtered, the 15 precipitate collected and dissolved in 2N sodium hydroxide (30 ml). The solution was heated on a steam bath for 15 minutes, acetic acid was then added to pH5, and the mixture cooled. The resulting precipitate was collected, washed and dried to give L-3,5-dibromo-3'-(6-oxo-3(1H)-pyridazinylmethyl)-thyronine (1.74 g, 88%), m.p. 278°-9° (dec.).

20 Alternatively, instead of using the perchlorate salt prepared in (d) for reaction step (e), the iodonium trifluoroacetate salt can be used which is prepared as follows:

Iodine (159 g) was suspended in trifluoroacetic anhydride (1 liter) and stirred under nitrogen whilst fuming nitric acid (350 ml) was added over 1.5 hours, keeping the temperature between 36° and 40°. Trifluoroacetic anhydride (300 ml) was then 25 added and the mixture maintained at 40° under a stream of nitrogen until all nitrogen oxides were removed, then allowed to stand at room temperature overnight. The solvent was then removed under reduced pressure and the residual solvent removed by azeotroping with trifluoroacetic anhydride (2 X 300 ml). The pale yellow residual solid was then suspended in trifluoroacetic anhydride (1.2 liters) with stirring and was cooled to -20°. A solution of 2-(6-chloro-3-

30 pyridazinylmethyl)anisole (600 g) in trifluoracetic acid (1.2 liters) was then added dropwise, maintaining the temperature between -10° and -20°. The mixture was stirred at -10° for 1 hour and at room temperature overnight, then the solvent removed under reduced pressure and the residue poured into a solution of sodium 35 sulphate (3.5 kg) in water (20 liters) with stirring. The pH of this mixture was adjusted to approximately pH 2 using dilute aqueous sodium hydroxide, then extracted with dichloromethane (2 X 3 liters, 1 x 2 liters), the organic extracts

combined, dried ($MgSO_4$), filtered, and reduced in volume to 2 liters, then added to vigorously stirred diethyl ether (12 liters). The dark grey precipitated solid was filtered off, washed with ether, and dried in a vacuum oven at 40° for 6 hours to give 4,4'-dimethoxy-3,3'-bis-(6-chloro-3-pyridazinylmethyl) diphenyl iodonium trifluoroacetate (8.14 g, 90%), m.p. 145°-147°.

5 Further reaction of this salt using procedures analogous to those described in 2(e), (f) and (g) above gives the required L-3,5-dibromo-3'-(6-oxo-3(1H)-pyridazinyl-methyl)thyronine.

10

Example 2A

Preparation of L-3,5-Dibromo-3'-(6-oxo-3(1H)-pyridazinylmethyl)thyronine (Compound 2)

15 (a) 2-(6-Chloro-3-pyridazinylmethyl)anisole (prepared as described in Example 2(c)(2.35 g) was dissolved in dry dichloromethane (20 ml) and cooled with stirring to -50°. Boron tribromide (3 ml) was then added dropwise, and the solution was allowed to warm to room temperature. After 0.5 hours the orange reaction mixture was poured into ice/water (200 ml) and acetone added to dissolve the precipitated solid. The mixture was extracted with dichloromethane, the organic extracts were separated, washed with water, dried, and evaporated. The residue was recrystallised from ethyl acetate and petroleum spirit to give 2-(6-chloro-3-pyridazinylmethyl)-phenol (1.75 g, 80%), m.p. 132°-132.5°. Anal. Found: C, 59.61; H, 4.13; N, 12.47; Cl, 16.09; $C_{11}H_9ClN_2O$ Requires: C, 59.87; H, 4.11; N, 12.70; Cl, 16.07%.

20 (b) To a stirred solution of this phenol (2.4 g) and urea (14 g) in 75% aqueous sulphuric acid (100 ml) t-butanol (17 ml) was added slowly. The mixture was stirred well and further quantities of t-butanol were added after 4 hours (18 ml), 24 hours (5 ml), and 28 hours (20 ml). After 120 hours the mixture was poured into water, the organic phase separated and discarded and the aqueous phase extracted thoroughly with ether. The combined ether extracts were washed with saturated brine, then dried and evaporated. The residue was recrystallised from ether and petroleum spirit to give 2,4-di-t-butyl-6-(6-chloro-3-pyridazinylmethyl)phenol (3.43 g, 94%), m.p. 143.0°-143.5°. Anal. Found: C, 68.32; H, 7.51; N, 8.36; Cl, 10.89; $C_{19}H_{25}ClN_2O$. Requires: C, 68.56; H, 7.57; N, 8.41; Cl, 10.65%).

25 (c) A solution of this phenol (1.95 g), L-3,5-dibromo-N-trifluoroacetyl tyrosine methyl ester (3.24 g) in diethyl ether (100 ml) was stirred under argon at

room temperature and then treated with active manganese dioxide (3 X 5 g). After 4 hours the mixture was filtered, and titanium tetrachloride (5 ml) added. After 2 minutes the dark solution was treated with water and extracted well with ethyl acetate. The organic extracts were combined, washed with saturated brine, dried and evaporated. The residue was chromatographed on silica gel with petroleum spirit and ether as eluant to give L-3,5-dibromo-5'-t-butyl-3'-(6-chloro-3-pyridazinylmethyl)-N-trifluoroacetyl thyronine methyl ester (2.31 g, 55%), m.p. 84°-86°.

5 (d) A solution of this dibromothyronine (2.76 g) and anhydrous sodium acetate (0.78 g) in acetic acid (25 ml) was heated at reflux for 10 hours, then cooled and poured into ice-water. The precipitated solid was filtered off, dissolved in ethyl acetate, dried, and evaporated to give L-3,5-dibromo-5'-t-butyl-3'-(6-oxo-3(1H)-pyridazinylmethyl)-N-trifluoroacetylthyronine methyl ester, (2.4 g, 55%), m.p. 112°-115°.

10 (e) A solution of this pyridazinone (0.200 g) and Hbr (1 ml) in glacial acetic acid (20 ml) was heated at reflux for three days. The solution was then cooled, diluted with water, basified with aqueous 2N sodium hydroxide solution and brought to pH 6 by addition of acetic acid. The precipitated solid was filtered, washed, and dried to give L-3,5-dibromo-3'-(6-oxo-3(1H)-

15 pyridazinylmethyl)thyronine (0.100 g, 65%), m.p. 245°-247° (dec.), spectroscopically identical with that previously isolated (Example 2(g)).

20

Example 2B

25 Preparation of L-3,5-Dibromo-3'-(6-oxo-3(1H-pyridazinylmethyl)-thyronine (Compound 2)

(a) To a solution of iodine tris trifluoroacetate (prepared by treatment of iodine (10.0 g) with fuming nitric acid (20.95 ml) in acetic anhydride and trifluoroacetic acid) in acetic anhydride (50 ml), cooled to -10°, was added dropwise 30 a solution of 2-methoxybenzyl cyanide (30.0 g) in trifluoroacetic acid (60 ml) and acetic anhydride (30 ml). The temperature of the mixture was maintained below 0° during the addition then allowed to stand at room temperature overnight. The mixture was then poured into a well-stirred ice-cold solution of sodium acetate (100 g) and sodium perchlorate (13.0 g) in water (600 ml). The solid which precipitated 35 was filtered off, washed with water and diethyl ether to give 3,3'-dicyanomethyl-4,4'-dimethoxy-diphenyl iodonium perchlorate as a fine buff solid (23.6 g, 57%), m.p. 183°-4° (from methanol/diethyl ether).

(b) A solution of this iodonium salt (22.6 g), L-3,5-dibromo-N-trifluoroacetyl-tyrosine methyl ester, triethylamine (6.1 g) in dichloromethane (300 ml) was treated with copper bronze (1 g) and the mixture stirred at room temperature for 20 hours. The mixture was then filtered and the filtrate washed with 2N aqueous hydrochloric acid (2 X 200 ml), water (2 X 200 ml), and 2N aqueous sodium hydroxide solution (3 X 200 ml), then the organic solution was dried over magnesium sulphate and evaporated under reduced pressure. The oily residue was dissolved in dichloromethane (30 ml) and poured into petroleum spirit. A solid precipitated which was filtered off and recrystallised from dichloromethane/petroleum spirit to give L-3,5-dibromo-3'-cyanomethyl-O-methyl-N-trifluoroacetylthyronine methyl ester as a colourless crystalline solid, m.p. 148°-149°. The mother liquors were chromatographed on silica gel to give further quantities of this compound (total = 8.05 g, 31%).

(c) To a solution of this dibromothyronine (120 mg) and 3,6-dichloropyridazine (31 mg) in dry dimethylformamide (2 ml), sodium hydride (30 mg of a 50% suspension in oil) was added and the reaction mixture allowed to stand at room temperature for 50 min. It was then treated with ice, and the aqueous mixture extracted with dichloromethane, the organic solution washed with saturated brine, then dried and evaporated. The residue was chromatographed on a preparative silica gel chromatography plate from which 3,5-dibromo-3'-(1-(6-chloro-3-pyridazinyl)-1-cyanomethyl)-O-methyl-N-trifluoroacetylthyronine methyl ester (5 mg) was isolated. ¹H NMR δ(CDCl₃) 3.12 (1H, m), 3.27 (1H, m), 3.79 (3H, s), 3.86 (3H, s), 4.86 (1H, m), 5.80 (1H, s), 6.72 (1H, dd), 6.83 (1H, d), 7.04 (1H, d), 7.15 (1H, broad m), 7.37 (2H, s), 7.50 (2H, dd).

Elaboration of this intermediate by standard methods gives the title compound.

Example 3

Preparation of 8,8-Ethylenedioxy-2,3,7,8,9,10-hexahydro-4-methyl-1H-benzo[b]thieno[2,3-b]pyrazolo[3,4-d]pyridin-3-one (Compound 3)

a) Ethyl 2-Cyano-2-(4,4,-ethylenedioxycyclohexylidene)acetate

To a mixture of 1,4 cyclohexanedione monoethylene ketal (25 g, 0.160 mol) and ethyl cyanoacetate (18 g, 0.160 mol) in toluene (400 mL) was added dropwise diethylamine (25 g, 0.337 mol) at room temperature. The reaction mixture was heated at reflux overnight (using a Dean Stark apparatus). The mixture was cooled and partitioned with ethyl acetate and saturated aqueous sodium bicarbonate (3x). The organic extracts were dried over sodium sulfate, filtered, concentrated in vacuo and recrystallized from ethanol to yield the title compound as an white solid (15.8 g, 45%): mp 80-81 °C; ¹H NMR (400 MHz, CDCl₃) δ 4.28 (q, *J* = 7.2 Hz, 2 H), 4.00 (s, 4 H), 3.18 (t, *J* = 6.5 Hz, 2 H), 2.85 (t, *J* = 6.5 Hz, 2 H), 1.89 (t, *J* = 6.5 Hz, 2 H), 1.82 (t, *J* = 6.5 Hz, 2 H), 1.35 (t, *J* = 7.1 Hz, 3 H).

15 b) Ethyl 2-Amino-6,6-ethylenedioxy-4,5,6,7-tetrahydrobenzo[b]thiophene-3-carboxylate

To a suspension of compound of Example 3(a) (10 g, 45.6 mmol), sulfur (1.6 g, 50.2 mmol) in ethanol (164 mL) at 0 °C, was added dropwise a solution of diethylamine (3.6 g, 50.2 mmol) in ethanol (26 mL). The resulting solution stirred at 0 °C for 1 h, then at room temperature for 3.5 h. The reaction mixture was quenched with ethyl acetate and partitioned with saturated aqueous ammonium chloride solution. The aqueous phase was extracted with ethyl acetate, and the organic extracts were washed with brine. The combined organic extracts were dried over sodium sulfate, filtered, concentrated in vacuo and chromatographed (silica gel, gradient 5 to 10% CH₂Cl₂:EtOAc) to yield the title compound as an oil (11.3 g, 87%). ¹H NMR (400 MHz, CDCl₃) δ 4.25 (q, *J* = 7.1 Hz, 2 H), 4.02(s, 4 H), 2.92 (t, *J* = 6.5 Hz, 2 H), 2.74 (s, 2 H), 1.90 (t, *J* = 6.6 Hz, 2 H), 1.33 (t, *J* = 7.1, 3 H).

30 c) Ethyl 7,7-Ethylenedioxy-4-hydroxy-2-methyl-5,6,7,8-tetrahydrobenzo[b]thieno[2,3-b]pyridine-2-carboxylate

To a solution of compound of Example 3(b) (11.2 g, 39.5 mmol) in toluene (307 mL) at room temperature was added ethyl 3-ethoxycrotonate (12.4 g, 78.6

mmol) and camphorsulfonic acid (0.78 g, 3.4 mmol). The reaction mixture was heated at reflux for 3.5 h using a Dean Stark trap. The mixture was then cooled, and to it was added dropwise a freshly prepared solution of 1 M sodium ethoxide (49 mL). Once the addition was complete the reaction mixture was heated at reflux for 3 h. The mixture was cooled and the precipitate was filtered. The salt was dissolved in methanol (60 mL), to it was added water (500 mL) and acetic acid (2 mL) to yield the title compound as a yellow solid (10.4 g, 76%): mp 94-95 °C; ¹H NMR (400 MHz, CDCl₃) δ 4.48 (q, J = 7.1 Hz, 2 H), 4.06(s, 4 H), 3.26 (t, J = 6.5 Hz, 2 H), 3.02 (s, 2 H), 2.81 (s, 3 H), 2.02 (t, J = 6.5, 2 H), 1.47(t, J = 7.1 Hz, 3 H); MS (ESI) m/z 350 [M + H]⁺; Anal. Calcd. for C₁₇H₁₉NO₅S; C, 58.44; H, 5.48; N, 4.01; Found: C, 58.34; H, 5.46; N, 3.86.

d) Ethyl 7,7-Ethylenedioxy-4-trifluoromethylsulfonyloxy-2-methyl-5,6,7,8-tetrahydrobenzo[b]thieno[2,3-b]pyridine-3-carboxylate

To a solution of compound of Example 3(c) (5.0 g, 14.3 mmol) in pyridine (50 mL) was added dropwise triflic anhydride (4.0 g, 14.2 mmol). The reaction mixture stirred at 0 °C for 4 h until complete. The reaction mixture was washed with aqueous copper sulfate solution (3x) followed by water (2x), and brine (2x). The organic layer evaporated, dried over anhydrous sodium sulfate and concentrated in vacuo. Purification by flash chromatography (silica gel, 1:1 hexane: ethyl acetate) yielded the title compound as a light yellow solid (3.7 g, 54%): mp 133-134 °C; ¹H NMR (400 MHz, CDCl₃) δ 4.43 (q, J = 7.2 Hz, 2 H), 4.06(s, 4 H), 3.16 (t, J = 6.5 Hz, 2 H), 3.10 (s, 2 H), 2.77 (s, 3 H), 2.03 (t, J = 6.8 Hz, 2 H), 1.41 (t, J = 7.1 Hz, 3 H); MS (ESI) m/z 482 [M + H]⁺; Anal. Calcd. for C₁₈H₁₈F₃NO₇S₂; C, 44.90; H, 3.77; N, 2.91; Found: C, 45.03; H, 3.62; N, 2.89.

e) 8,8-Ethylenedioxy-2,3,7,8,9,10-hexahydro-4-methyl-1H-benzo[b]thieno[2,3-b]pyrazolo[3,4-d]pyridin-3-one

To a solution of compound of Example 3(d) (2.4 g, 5.0 mmol) in methanol (40 mL) at room temperature was added hydrazine monohydrate (4.1 g, 82.3 mmol). The reaction mixture was heated at reflux for 3 h. The mixture was cooled then partitioned between pH 7 aqueous buffer and ethyl acetate. The organic layer was dried over anhydrous sodium sulfate, filtered, concentrated in vacuo and recrystallized from methanol/ethyl acetate to yield the title compound as a light yellow solid (0.99 g, 60%). ¹H NMR (400 MHz, d₄-MeOH) δ 4.05 (s, 4 H), 3.15 (t, J = 6.5 Hz, 2 H), 3.04 (s, 2 H), 2.82 (s, 3 H), 2.06 (t, J = 6.5 Hz, 2 H); MS (ESI) m/z

318 [M + H]⁺; Anal. Calcd. for C₁₅H₁₅N₃O₃S.0.25 H₂O: C, 55.97; H, 4.85; N, 13.05; Found: C, 55.85; H, 4.75; N, 13.30.

Example 4

5

Preparation of 4-[4-(4-Methylbenzoyl)benzoyl]phenylacetaldehyde
(Compound 4)

10

a) Methyl 4-(4-methylbenzoyl)benzoate

A solution of methyl terephthaloyl chloride (6.2 g, 31 mmol) in 250 mL of toluene was treated with aluminum chloride (8.0 g, 60 mmol) at 0°C under an argon atmosphere. The stirring mixture was warmed to 35°C for 0.5 h. and then added slowly to 100 g of ice, followed by 150 mL of ethyl acetate, 50 mL of conc. HCl, and 50 mL of water. The phases were separated, and the aqueous portion was extracted twice with 100 mL of ethyl acetate. The combined organic portions were washed with water (2 x 75 mL) and brine (1 x 75 mL), dried over magnesium sulfate, filtered, and concentrated to a white solid. Recrystallization from ethyl acetate and hexane afforded 6.0 g (79%) of the title compound as white needles. mp. 117-118°C; ¹H NMR (400 MHz, CDCl₃) δ 8.15 (d, J = 8.35 Hz, 2H), 7.83 (d, J = 8.30 Hz, 2H), 7.73 (d, J = 8.18 Hz, 2H), 7.31 (d, J = 8.04 Hz, 2H), 3.98 (s, 3H), 2.46 (s, 3H); MS (ESI) m/z 255 (M+H)⁺.

25 b) 4-(4-Methylbenzoyl)benzoic acid

A stirring solution of methyl 4-(4-methylbenzoyl)benzoate (5.00 g, 20.0 mmol) in 150 mL of 2:1 THF : water at 65°C was treated with lithium hydroxide monohydrate (2.0 g, 48 mmol). After a period of 0.5 h the cloudy reaction mixture was allowed to cool to room temperature and treated with ethyl acetate (300 mL) and 10% HCl (aq.). The organic phase was separated, washed with water (2 x 50 mL) and brine (1 x 50 mL), dried over magnesium sulfate, filtered, and concentrated to a white foam. ¹H NMR (400 MHz, CDCl₃) δ 8.22(d, J = 8.34 Hz, 2H), 7.81 (d, J = 8.31 Hz, 2H), 7.73 (d, J = 8.15 Hz, 2H), 7.31 (d, J = 8.00 Hz, 2H), 2.46 (s, 3H).

c) 4-[4-(4-Methylbenzoyl)benzoyl]anisole

A solution of compound of Example 4(b) in 250 mL of toluene was treated with oxalyl chloride (21.8 g, 0.17 mol). The resulting mixture was heated to reflux for 2 h, then concentrated and allowed to stand overnight at 0.5 mm Hg and 25°C. This solid was then dissolved in 100 mL of anisole and treated with aluminum chloride (11.2 g, 84 mmol) at 0°C. The mixture was heated to 70°C for 1 h and then added slowly to 100 g of ice, followed by 150 mL of ethyl acetate, 50 mL of conc. HCl, and 50 mL of water. The phases were separated and the aqueous portion was extracted with 100 mL of ethyl acetate. The combined organic extracts were washed with water (2 x 75 mL) and brine (1 x 75 mL), dried over magnesium sulfate, filtered, and concentrated to a white solid. Recrystallization from ethyl acetate and hexane yielded 4.6 g (70%) of the title compound. mp. 167-169°C; ¹H NMR (400 MHz, CDCl₃) δ 7.8-7.9 (m, 6H), 7.77 (d, J = 8.06 Hz, 2H), 7.32 (d, J = 8.01 Hz, 2H), 7.0 (d, J = 8.74 Hz, 2H), 3.92 (s, 3H), 2.47 (s, 3H); MS (ESI) m/z 331 (M+H)⁺.

d) 4-[4-(4-Methylbenzoyl)benzoyl]phenol

A solution of compound of Example 4(c) (700 mg, 2.12 mmol) in 20 mL of dichloromethane was treated with aluminum chloride (1.0 g, 7.5 mmol) and 7.0 mL of 1.0 M boron trichloride solution in dichloromethane and heated to reflux for 1 h. The mixture was then diluted with 100 mL of dichloromethane and washed with 10% HCl (aq) (1 x 25 mL), water (1 x 25 mL), and brine (1 x 25 mL). The organic phase was dried over magnesium sulfate, filtered, and concentrated to a dark residue which was subjected to flash chromatography (silica gel, elution with 1:1 ethyl acetate : hexane) to yield 550 mg (82%) of the title compound. ¹H NMR (400 MHz, CDCl₃) δ 7.8-7.9 (m, 6H), 7.77 (d, J = 8.05 Hz, 2H), 7.32 (d, J = 8.01 Hz, 2H), 6.93 (d, J = 8.6 Hz, 2H), 2.47 (s, 3H).

e) 4-[4-(4-Methylbenzoyl)benzoyl]phenyl trifluoromethylsulfonate

A solution of compound of Example 4(d) (320 mg, 1.0 mmol) in THF (20 mL) was treated with sodium hydride (40 mg, 1.67 mmol) and N-phenyltrifluoromethanesulfonimide (500 mg, 1.40 mmol) at 0 °C. The reaction mixture was allowed to warm up to room temperature and was then stirred for 18 h. room temperature. The reaction was then partitioned between ethyl acetate and brine; layers were separated and the organic extract was dried over magnesium sulfate and evaporated. Purification by flash chromatography (silica gel, 80:20 hexane : ethyl acetate) afforded the title compound (300 mg, 66%). mp. 180-

181 °C; ^1H NMR (400 MHz, CDCl_3) δ 7.96 (d, $J = 8.6$ Hz, 2 H), 7.89 (s, 4 H), 7.76 (d, $J = 8.1$ Hz, 2 H), 7.45 (d, $J = 8.6$ Hz, 2 H), 7.33 (d, $J = 8.1$ Hz, 2 H), 2.47 (s, 3 H).

5 f) 4-[4-(4-Methylbenzoyl)benzoyl]phenylacetaldehyde

To a solution of compound of Example 4(e) (445 mg, 1.0 mmol) in DMF (10 mL) was added allyltributyltin (0.35 mL, 1.12 mmol), bis(triphenylphosphine)palladium(II) chloride (55 mg, 0.077 mmol) and lithium chloride (125 mg, 2.95 mmol). The reaction mixture was heated to 90 °C for 1 h, and 10 then allowed to cool to room temperature before being partitioned between ethyl acetate and brine. The organic layer was dried over magnesium sulfate and concentrated to a residue consisting of the desired product, 3-[4-[4-(4-methylbenzoyl)benzoyl]phenyl]-1-propene, and tin-containing by-products. This material was subjected to flash chromatography (silica gel, elution with 95:5 hexane : ethyl acetate) which removed most, but not all, of the tin impurities. A second 15 chromatography (gradient 5% to 10% ethyl acetate in hexane) yielded 100 mg (30%) of clean olefin, which was then dissolved in dichloromethane/methanol (3:1, 16 mL) at -78 °C. Ozone was bubbled through this solution for 5 min. The reaction was quenched with five drops of dimethyl sulfide and stirring continued for 30 min at -78 °C. The solvent was evaporated and the resulting material purified by flash 20 chromatography (silica gel, elution with gradient 85:15 to 75:25 hexane : ethyl acetate) to yield the title compound (40 mg, 40%). mp. 188-190 °C; ^1H NMR (400 MHz, CDCl_3) δ 9.83 (s, 1 H), 7.88 (s, 4 H), 7.86 (d, $J = 8.1$ Hz, 2 H), 4.03 (s, 4 H), 3.73 (s, 3 H), 3.76 (t, $J = 6.0$ Hz, 2 H), 3.00 (s, 2 H), 2.80 (s, 3 H), 2.03 (t, $J = 6.0$ Hz, 2 H); MS (ESI) m/z 343 ($\text{M}+\text{H})^+$.

Example 5

30 Preparation of 1,4-Dimethyl-8,8-ethylenedioxy-2,3,7,8,9,10-hexahydro-1H-benzob[b]thieno[2,3-b]pyrazolo[3,4-d]pyridin-3-one (Compound 5)

1,4-Dimethyl-8,8-ethylenedioxy-2,3,7,8,9,10-hexahydro-1H-benzo[b]thieno[2,3-b]pyrazolo[3,4-d]pyridin-3-one

A solution of compound of Example 3(d) (0.4 g, 0.83 mmol) in methanol (6.7 mL) at room temperature was treated with methylhydrazine (0.16 g, 3.45 mmol) and the mixture is heated at reflux for 2 h. The mixture was cooled and the precipitate, containing 150 mg of the 2,4-dimethyl regioisomer, filtered. The filtrate was evaporated and purified by flash chromatography (silica gel, elution with 80:20:5 ethyl acetate:methanol:acetic acid) to provide the title compound as a yellow solid (22 mg). ^1H NMR (400 MHz, CDCl_3) δ 4.03 (s, 4 H), 3.73 (s, 3 H), 3.76 (t, J = 6.0 Hz, 2 H), 3.00 (s, 2 H), 2.80 (s, 3 H), 2.03 (t, J = 6.0 Hz, 2 H); MS (ESI) m/z 332 ($\text{M}+\text{H})^+$.

Example 6

15 Preparation of 4-carboxy-benzophenone-4-carboxamido-trans-4-methyl-cyclohexyl-N-hexyl carboxamide (Compound 6)

20 a) N-t-butyloxy carbonyl-trans-4-aminomethyl cyclohexyl carboxylic acid
 Aqueous sodium hydroxide (1N, 100 ml, 100 mmol) was added to a solution of 4-trans-aminomethyl-cyclohexyl-carboxylic acid (9.0g, 60 mmol), in dioxane (100 ml), water (100 ml) at 0 degrees C. Boc anhydride (15.9 g, 66 mmol) was added and the reaction was warmed to rt and stirred overnight. The solution was concentrated to 50 ml, then was diluted with EtOAc (100 ml) and acidified to pH 2 with aqueous KHSO_4 (1N). The organic layer was then extracted with water (100 ml) two times, and the organics were concentrated in vacuo. The solid was recrystallized from EtOAc/ hexanes to yield 9.2g + 3.4g (second crop) of a white solid. (80% yield). MS (ES) m/e 242 [$\text{M}+\text{H})^+$.
 b) N-t-butyloxy carbonyl-trans-4-aminomethyl cyclohexyl (Kaiser oxime resin) carboxylate
 Kaiser oxime resin (20 g, 0.7 mmol/g loading, Advanced Chem Tech) was added to a solution of N-t-butyloxy carbonyl-trans-4-aminomethyl cyclohexyl

carboxylic acid (5.0 g, 20 mmol) and DCC (4.4 g, 20 mmol) in methylene chloride (200 ml) and was gently mixed at rt overnight. The solid was filtered and collected, then washed with methylene chloride (5 x 100 ml). Then the resin was resuspended in methylene chloride (200 ml), and N-t-butyloxy carbonyl-trans-4-aminomethyl

5 cyclohexyl carboxylic acid (5.0 g, 20 mmol) and DCC (4.4 g, 20 mmol) were added and the reaction was gently mixed overnight at rt. The solid was filtered and collected, then washed with methylene chloride (5 x 100 ml), then was dried overnight under vacuum. IR (KBr, cm⁻¹)=1820, 1771, 1520.

10 c) trans-4-aminomethyl cyclohexyl (Kaiser oxime resin) carboxylate
N-t-butyloxy carbonyl-trans-4-aminomethyl cyclohexyl (Kaiser oxime resin) carboxylate (20 g) was suspended in methylene chloride (100 ml) and TFA (25 ml) was added. The reaction was gently mixed for 0.5 h, then the solid was filtered and collected, then was washed with with methylene chloride (5 x 100 ml), then was

15 dried overnight under vacuum. IR (KBr, cm⁻¹)=3150, 1770, 1526..

d) 4-carboxy-benzophenone-4-carboxamido-trans-4-methyl-cyclohexyl-(Kaiser oxime resin) carboxylate
Trans-4-aminomethyl cyclohexyl (Kaiser oxime resin) carboxylate (200 mg)

20 was suspended in DMF (3.0 ml) and N-methyl morpholine (0.2 ml) and 4, 4'-benzophenone dicarboxylic acid (190 mg, 0.7 mmol) and HBTU (265 mg, 0.7 mmol) was added and the reaction was gently mixed for 3 h. The solid was filtered and collected, then was washed with with DMF (3 x 20 ml), then water (3 x 20 ml), then was resuspended in DMF (3.0 ml) and N-methyl morpholine (0.1 ml) and 4,4'-

25 benzophenone dicarboxylic acid (0.35 mmol) and HBTU (0.35 mmol) was added and the reaction was gently mixed for 3 h. The solid was filtered and collected, then was washed with with DMF (3 x 20 ml), then water (3 x 20 ml), then methylene chloride (5 x 20 ml), then was dried under vacuum.

30 e) 4-carboxy-benzophenone-4-carboxamido-trans-4-methyl-cyclohexyl-N-hexyl carboxamide
4-carboxy-benzophenone-4-carboxamido-trans-4-methyl-cyclohexyl-(Kaiser oxime resin) carboxylate (200 mg) was suspended in methylene chloride (3.0 ml) and hexyl amine (0.3 mmol) was added. The reaction was gently mixed for 3 h then

35 was filtered, and the filtrate was concentrated in vacuo to yield the title compound:
MS (ES) m/e 493 [M+H]⁺.

Example 7Preparation of 4-nitro-benzamido-trans-4-methyl-cyclohexyl-N-hexyl carboxamide
(Compound 7)

5

4-nitro-benzamido-trans-4-methyl-cyclohexyl-N-hexyl carboxamide

Following the procedure of Example 6(a)-(e), except substituting 4-nitro benzoic acid for and 4, 4'-benzophenone dicarboxylic acid, the title compound was
10 prepared: MS (ES) m/e 390 [M+H]⁺.

Example 8Preparation of 4-acetamido-benzamido-trans-4-methyl-cyclohexyl-N-1-(amino-R-2-(methoxy methyl)-pyrrolidine) carboxamide (Compound 8)

15

Following the procedure of Example 6(a)-(e), except substituting 4-acetamido- benzoic acid for and 4, 4'-benzophenone dicarboxylic acid and R-1-amino-2-(methoxy methyl)- pyrrolidine (RAMP) for hexyl amine, the title
20 compound was prepared: MS (ES) m/e 331 [M+H]⁺.

Example 9Preparation of 4-formyl-E-cinnamido-trans-4-methyl-cyclohexyl-N-(propyl) carboxamide (Compound 9)

25

Following the procedure of Example 6(a)-(e), except substituting 4-formyl

cinnamic acid for and 4, 4'-benzophenone dicarboxylic acid and propyl amine for hexyl amine, the title compound was prepared: MS (ES) m/e 357 [M+H]⁺.

Example 10

5

Preparation of 2,3,7,8,9,10-Hexahydro-4-methyl-1H-benzo[b]thieno[2,3-b]pyrazolo[3,4-d]pyridin-3-one (Compound 10)

10

a) Ethyl 4-Hydroxy-2-methyl-5,6,7,8-tetrahydrobenzo[b]thieno[2,3-b]pyridine-2-carboxylate

A solution of ethyl 2-amino-4,5,6,7-tetrahydrobenzo[b]thiophene-3-carboxylate (8.9 g, 39 mmol) and ethyl 3-ethoxycrotonate (12.4 g, 78 mmol) in toluene (300 mL) was treated with camphorsulfonic acid (0.78 g, 3.4 mmol) and the reaction mixture was heated at reflux for 3 h using a Dean Stark trap. The mixture was then cooled to room temperature and was subsequently treated with a freshly prepared 1 M solution of sodium ethoxide (48 mL, 48 mmol). After addition was complete the reaction mixture was heated at reflux for 3 h. The mixture was cooled, concentrated and the residue dissolved in ethyl acetate. Acetic acid (2 mL) was added, solvent evaporated and resulting solid triturated with methanol to yield the title compound as an off-white solid (8.4 g, 74%): mp 140 °C; ¹H NMR (400 MHz, CDCl₃) δ 4.48 (q, J = 7.2 Hz, 2 H), 3.04 (br s, 2 H), 2.81 (s, 3 H), 2.80 (br s, 2 H), 1.87 (br s, 4 H), 1.47 (t, J = 7.2 Hz, 3 H); Anal. Calcd. for C₁₅H₁₇NO₃S: C, 61.83; H, 5.88; N, 4.81; Found: C, 61.69; H, 5.81; N, 4.73.

25

b) Ethyl 4-Chloro-2-methyl-5,6,7,8-tetrahydrobenzo[b]thieno[2,3-b]pyridine-2-carboxylate

A solution of compound of Example 10(a) (8.0 g, 27.4 mmol) in phosphorus oxychloride (100 mL) was refluxed for 3.5 hours. The phosphorus oxychloride was removed under vacuum and the residual oil was dissolved in ethyl acetate, washed with 5% aqueous sodium bicarbonate and dried over anhydrous sodium sulfate. Evaporation of the solvent provided the title compound as a crystalline solid (8.5 g,

95%); mp 65-66 °C; ^1H NMR (400 MHz, CDCl_3) δ 4.47 (q, $J = 7.1$ Hz, 2 H), 3.10 (br s, 2 H), 2.85 (br s, 2 H), 2.60 (s, 3 H), 1.89 (br s, 4 H), 1.43 (t, $J = 7.1$ Hz, 3 H); Anal. Calcd. for $\text{C}_{15}\text{H}_{16}\text{ClNO}_2\text{S} \cdot 0.125 \text{H}_2\text{O}$: C, 57.73; H, 5.25; N, 4.49; Found: C, 57.69; H, 5.08; N, 4.30.

5

c) 2,3,7,8,9,10-Hexahydro-4-methyl-1H-benzo[b]thieno[2,3-b]pyrazolo[3,4-d]pyridin-3-one

A solution of compound of Example 10(b) (2.0 g, 6.4 mmol) in methanol (50 mL) was treated with hydrazine monohydrate (10 mL) and the resulting mixture was heated at reflux for 16 h. The reaction was poured over diluted aqueous hydrochloric acid and the title compound precipitated as a yellow solid (1.8 g). ^1H NMR (400 MHz, $d_4\text{-MeOH}$) δ 3.01 (br s, 2 H), 3.00 (s, 3 H), 2.92 (br s, 2 H), 2.00 (br s, 4 H); Anal. Calcd. for $\text{C}_{13}\text{H}_{13}\text{N}_3\text{OS} \cdot \text{HCl} \cdot 0.25 \text{H}_2\text{O}$: C, 52.00; H, 4.87; N, 13.99; Found: C, 51.92; H, 5.01; N, 13.70.

15

Example 11-Protocol for the Determination of Activity of Compounds at Human SH2 Domains

The activity of compounds at the different human SH2 domains is determined *in vitro* using SH2 domains expressed as fusion proteins either in *E. coli* or baculovirus. The SH2 domains used herein were the human forms of the Stat 6 SH2 domain, src SH2 domain, Grb2 SH2 domain, lck SH2 domain, Stat 5 SH2 domain, fyn SH2 domain, SH-PTP2 SH2 domain, p85 SH2 domain and hcp SH2 domain.

The fusion proteins containing the src, Stat 6, lck, Stat 5 and hcp SH2 domains were expressed as the general sequence: DET1-DET2-spacer-ek-SH2, where DET1, DET2, spacer, ek and SH2 are as described below. DET1 ("defined epitope tag 1") (SEQ ID NO: 1) is an 11 amino acid sequence found in the Human Immunodeficiency Virus Type 1 (HIV-1) envelope protein gp120 (or gp160). Monoclonal antibodies to various epitopes of HIV-1 gp120 (or gp160) are known in the art, see, for example U.S. Patent 5,166,050. One preferred example is monoclonal antibody 178.1 (see, e.g., Thiriart et al., *J. Immunol.*, **143**:1832-1836 (1989)), which was prepared by immunization of mice with a yeast-expressed HIV-1 gp160 molecule from strain BH10 (Ratner et al., *Nature*, **313**:277-284 (1985)). This

tag was used for detection of expression (by Western blot), for purification of the protein (by affinity chromatography), and for configuring assays in which the fusion protein is captured or immobilized using the 178.1 antibody. DET2 is a hexa-histidine sequence tag (SEQ ID NO: 2) which binds to nickel-containing resins and 5 was used for purification purposes. Spacer (SEQ ID NO: 3) was utilized to design a BamH1 restriction site at the indicated position of the construct. The term -ek- refers to a recognition sequence (SEQ ID NO: 4) for the enterokinase protease which provides for the optional removal of the tags from the SH2 domain, thus producing an SH2 domain that contains no extraneous amino acids. SH2 domains which 10 contain no extraneous amino acids are preferable to tagged protein for crystallography studies. SH2 refers to the SH2 domains of different proteins.

The DNA sequence encoding each DET1-DET2-spacer-ek-SH2 was designed such that the indicated restriction sites (BamH1 and XbaI) flank the spacer-ek-SH2 region, thereby allowing different spacer-ek-SH2 constructs to be readily 15 substituted into any one of the vectors described in Procedures 2, 3, 5 or 6 below to create a DET1-DET2-spacer-ek-SH2 tagged protein. The DNA sequence encoding each DET1-DET2-spacer-ek-SH2 construct was also designed such that the entire tagged SH2 domain can be moved as an NdeI-XbaI fragment into any expression vector containing an NdeI site at an appropriate distance downstream of E. coli or 20 baculovirus transcription and translation regulatory sequences and a downstream cloning site compatible with XbaI. Although any suitable vector would yield similar results (e.g., pET-11a; Novagen, Inc.), the vector used in the instant experiments are the E. coli expression vector pEA1KnRBS3. This vector is a derivative of the series of vectors described in Shatzman, A, Gross, M, and Rosenberg, M, 1990, 25 "Expression using vectors with phage lambda regulatory sequences", In: Current Protocols in Molecular Biology (F.A. Ausubel et al , eds.), pp. 16.3.1-16.3.11, Greene Publishing and Wiley-Interscience, N.Y. (hereinafter F.A. Ausubel et al.). The specific vector pEA1KnRBS3 is described in Bergsma et al, 1991, J. Biol. Chem. 266:23204-23214.

30 The procedures below describe the expression of chicken src, human src, human Stat 6, human lck, human Stat 5 and human hcp SH2 domains. First, the

chicken src SH2 domain was expressed as DET1-DET2-spacer-SH2. Then, the others were inserted into this vector in place of chicken src to express proteins in the form DET1-DET2-spacer-ek-spacer-SH2 as described in procedures 1 to 6 below.

5 Procedure 1: Cloning and Expression of chicken src SH2 domain containing tags DET1 and DET2 (DET1-DET2-spacer-SH2).

A DNA sequence encoding the tagged protein DET1-DET2-spacer-SH2 was PCR amplified from a cDNA clone containing the chicken src gene (p5H; Levy et al 1986. Proc. Natl. Acad. Sci. USA 83:4228) by methods well known to those skilled 10 in the art by using the following primers:

5'

TTCCCATATGAAAAGTATT~~CGT~~TTCAGCGTGGCCGGGCCGTACCA
CCACCACCACGGGATCCCCGCTGAAGAGTGGTACTTT 3' (SEQ ID NO: 17)

15

The underlined sites are an NdeI recognition site (5') and a BamHI recognition site (3').

5' GGAATTCTAGATTACTAGGACGTGGGCAGACGTT 3' (SEQ ID NO: 18)

20

The underlined region is an XbaI recognition site.

The PCR product was digested with NdeI and XbaI, followed by isolation of the digested fragment on an agarose gel. The fragment was ligated into NdeI-XbaI-digested pEA1KnRBS3 vector (Bergsma et al, supra) that had been agarose gel 25 purified as a 6.5 kbp fragment. The ligation reaction was used to transform E. coli MM294cl^r (F.A. Ausubel et al., supra). A plasmid containing an insertion of the correct fragment was identified and confirmed by DNA sequencing. The resultant plasmid encodes DET1-DET2-spacer-SH2 under the control of the phage lamda P_L promoter and regulatory system. Plasmid DNA was purified from MM294cl^r and 30 used to transform E. coli strain AR120. In this host strain, expression of the phage promoter can be induced by addition of nalidixic acid to the growing culture as

described in F.A. Ausubel et al, supra. Nalidixic acid induction of AR120 containing this plasmid, followed by analysis of the cellular proteins on an SDS-polyacrylamide gel stained with Coomassie Blue (F.A. Ausubel et al., supra), resulted in appearance of a protein band with an apparent molecular weight of 5 15,000; this band was not seen in uninduced cells or in induced cells containing pEA1KnRBS3 lacking the PCR amplified fragment. Western blotting confirmed that the induced protein band reacted with the anti-DET1 monoclonal antibody 178.1.

10 Procedure 2: Cloning, expression and purification of human src SH2 domain containing tags and an enterokinase proteolytic cleavage site (DET1-DET2-spacer-ek-src SH2).

15 A DNA sequence encoding protein ek-src SH2 was PCR amplified from a cDNA clone containing the human src gene (c-src SH2 DNA sequence identical to that described in Takeya,T. and Hanafusa, H, 1983 Cell 32:881-890) using the following primers:

5' CGGGATCTGGACGACGACGACAAAGCTGAGGAGTGGTATT 3'
(SEQ ID NO: 19)

20 The underlined site is a BamHI recognition site.

5' GGAATTCTAGACTATTAGGACGTGGGGCACACGGT 3' (SEQ ID NO: 20)

25 The underlined region is an XbaI recognition site.

30 The PCR product was digested with BamHI and XbaI, followed by isolation of the digested fragment on an agarose gel. The fragment was ligated into BamHI-XbaI-digested expression vector containing the tagged chicken src gene DET1-DET2-spacer-SH2 described in Procedure 1 above. In that vector, the BamHI site is located between the coding regions for DET2 and SH2, and the XbaI site is located

after the 3' end of the SH2 coding region. The ligation reaction was used to transform *E. coli* MM294cI'. The construct DET1-DET2-spacer-ek-src SH2 was confirmed by DNA sequencing (SEQ ID NO: 5) and induced in *E. coli* strain AR120 as described in Procedure 1 above. A Coomassie-Blue-stained, Western-blot-
5 positive induced protein band with an apparent molecular weight of 16,000 was observed after nalidixic acid induction.

Cells were lysed at neutral pH by sonication in the presence of lysozyme. After centrifugation, the soluble extract was chromatographed on a Ni⁺⁺NTA column. After washing the column with equilibration buffer (Tris buffer pH 8
10 containing 0.5 M NaCl) and the same buffer containing 15 mM imidazole, the protein was eluted in highly purified form with 25 mM imidazole in equilibration buffer. The SH2 domain, purified in this fashion, was found to bind with high affinity in a specific, saturable fashion to the appropriate pY peptide in the "Binding Assays" described below, demonstrating that the tag did not interfere with function.
15 This expressed fusion protein, DET1-DET2-spacer-ek-src SH2, was utilized in the "Binding Assays" described below in order to determine the specificity of compounds to selectively inhibit the human src SH2 domain.

Procedure 3: Cloning and expression of human lck SH2 domain containing tags and
20 an enterokinase proteolytic cleavage site (DET1-DET2-spacer-ek-lck SH2).

A DNA sequence encoding protein ek-lck SH2 was PCR amplified from a cDNA clone containing the human lck gene (Genbank accession number M36881) using the following primers:
25 5' CGGGATCCTGGACGACGACGACAAAGAGGCCGAACCCTGGTTCTT 3'
(SEQ ID NO: 21)

The underlined site is a BamHI recognition site.

30 5' GCTCTAGACTATTACTGGGGCTTCTGGGTCTG 3' (SEQ ID NO: 22)

The underlined region is an XbaI recognition site.

The PCR product was digested with BamHI and XbaI, followed by isolation of the digested fragment on an agarose gel. The fragment was ligated into BamHI-XbaI-digested expression vector containing the tagged chicken src gene DET1-

5 DET2-spacer-SH2 described in Procedure 1 above. In that vector, the BamHI site is located in between the coding regions for DET2 and SH2, and the XbaI site is located after the 3' end of the SH2 coding region. The ligation reaction was used to transform *E. coli* MM294cl^r. The construct containing DET1-DET2-spacer-ek-lck SH2 was confirmed by DNA sequencing (SEQ ID NO: 6) and induced in *E. coli* strain AR120 as described in Procedure 1 above. A Coomassie-Blue-stained, 10 Western-blot-positive induced protein band with an apparent molecular weight of 17,000 was observed after nalidixic acid induction.

Cells were lysed at neutral pH by sonication in the presence of lysozyme.

After centrifugation, the soluble extract was chromatographed on a Ni⁺⁺NTA

15 column. After washing the column with equilibration buffer (Tris buffer pH 8 containing 0.5 M NaCl) and the same buffer containing 15 mM imidazole, the protein was eluted in highly purified form with 25 mM imidazole in equilibration buffer. The SH2 domain, purified in this fashion, was found to bind with high affinity in a specific, saturable fashion to the appropriate pY peptide in the "Binding Assays" described below, demonstrating that the tag did not interfere with function. 20 This expressed fusion protein, DET1-DET2-spacer-ek-lck SH2, was utilized in the "Binding Assays" described below in order to determine the specificity of compounds to selectively inhibit the human lck SH2 domain.

25 Procedure 4: Cloning and expression of human hcp SH2 domain containing tags and an enterokinase proteolytic cleavage site (DET1-DET2-spacer-ek-hcp SH2).

A DNA sequence encoding protein ek-hcp SH2 (hcp SH2 DNA sequence identical to that described in Shen, S-H. *Nature* (1991) 352: 736-739) was reverse transcriptase-PCR amplified from human fetal liver RNA. RNA isolation used Tri-Reagent (Molecular Research Center Inc.) and the Reverse Transcriptase system (GIBCO-BRL) according to the manufacturer's instructions. PCR was carried out 30

using the following primers:

5' GAAGATCTTGGACGACGACGACAAATCCCGTGGGTGGTTTCAC
3'(SEQ ID NO: 23)

5

The underlined site is a BglII recognition site.

5' GCTCTAGACTATTAACTAGTGGGATCGGAGCA 3' (SEQ ID NO: 24)

10 The underlined region is an XbaI recognition site.

The PCR product was digested with BglII and XbaI, followed by isolation of the digested fragment on an agarose gel. The fragment was ligated into BamHI-XbaI-digested expression vector containing the tagged human src gene DET1-DET2-spacer-ek-src SH2 described in Procedure 2 above. In that vector, the 15 BamHI site is located in between the coding regions for DET2 and ek, and the XbaI site is located after the 3' end of the SH2 coding region. Thus, the ek-hcp SH2 sequence replaced the ek-src SH2 sequence in the above vector. The ligation reaction was used to transform *E. coli* MM294c Γ . The construct containing DET1-DET2-spacer-ek-hcp SH2 was confirmed by DNA sequencing (SEQ ID NO: 7) and 20 used to transform *E. coli* GI698 (Invitrogen Corporation, San Diego, CA). Induction of the phage lambda promoter was induced by addition of tryptophan to the culture medium to 10 mg/ml, per the manufacturer's instructions. A Coomassie-Blue-stained, Western-blot-positive induced protein band with an apparent molecular weight of 15,000 was observed after tryptophan induction of cells growing at 30° C.

25 Cells were lysed at neutral pH by sonication in the presence of lysozyme.

After centrifugation, the insoluble pellet was solubilized with 8 M urea in Tris buffer pH 8 and bound onto a Ni⁺⁺NTA column. The resin was washed with equilibration buffer (Tris buffer pH 8 containing 0.5 M NaCl, 8 M urea and 5 mM BME) and the same buffer containing 15 mM imidazole. The protein was refolded on the column 30 during the removal of urea in the presence of 5 mM BME and the purified refolded protein eluted with 300 mM imidazole in Tris buffer pH 8. The SH2 domain,

purified in this fashion, was found to bind with high affinity in a specific, saturable fashion to the appropriate pY peptide in the "Binding Assays" described below, demonstrating that the tag did not interfere with function and that the protein was refolded successfully. This expressed fusion protein, DET1-DET2-spacer-ek-hcp
5 SH2, was utilized in the "Binding Assays" described below in order to determine the specificity of compounds to selectively inhibit the human hcp SH2 domain.

10 **Procedure 5:** Cloning, expression and purification of human Stat 6 SH2 domain containing tags and an enterokinase proteolytic cleavage site (DET1-DET2-spacer-ek-Stat 6 SH2).

A DNA sequence encoding protein ek-Stat 6-SH2 was PCR amplified from a cDNA clone containing the human Stat 6 gene (Stat 6 SH2 DNA sequence identical to that described in Science 265, (1994) 1701) using the following primers:

15 5' CGGGATCCTGGACGACGACAACTCCGGAGCTAC-3' (SEQ ID NO:
27)

The underlined site is a BamHI recognition site.

20 5' GGAATTCTAGACTACTTGATGGTAGC-3' (SEQ ID NO: 28)

The underlined region is an XbaI recognition site.

25 The PCR product was digested with BamHI and XbaI, followed by isolation of the digested fragment on an agarose gel. The fragment was ligated with the vector fragment derived from BamHI-XbaI digestion of the expression vector containing the tagged human src gene DET1-DET2-spacer-ek-src SH2 described in Procedure 2 above. In that vector, the BamHI site is located between the coding regions for DET2 and SH2, and the XbaI site is located after the 3' end of the SH2
30 coding region. The ligation reaction was used to transform E. coli MM294cl+. The construct DET1-DET2-spacer-ek-Stat 6 SH2 was confirmed by DNA sequencing

(SEQ ID NO: 29) and induced in *E. coli* strain GI698 (Invitrogen Corporation, San Diego, CA). Induction of the phage lambda promoter was induced by addition of tryptophan to the culture medium to 10 mg/ml, per the manufacturer's instructions, also as described in procedure 4. A Coomassie-Blue-stained, Western-blot-positive
5 induced protein band with an apparent molecular weight of 15,000 was observed after tryptophan induction of cells growing at 27° C.

Cells were lysed at neutral pH by sonication in the presence of lysozyme. After centrifugation, the soluble extract was chromatographed on a Ni++NTA column. After washing the column with equilibration buffer (Tris buffer pH 8
10 containing 0.5 M NaCl) and the same buffer containing 15 mM imidazole, the protein was eluted in highly purified form with 25 mM imidazole in equilibration buffer. This expressed fusion protein, DET1-DET2-spacer-ek-STAT 6 SH2, is utilized in the "Binding Assays" described below in order to determine the specificity of compounds to selectively inhibit the human Stat 6 SH2 domain.
15

Procedure 6: Cloning, expression and purification of human Stat 5 SH2 domain containing tags and an enterokinase proteolytic cleavage site (DET1-DET2-spacer-ek-Stat 5 SH2).

A DNA sequence encoding protein ek-Stat 5-SH2 (Stat 5 SH2 DNA
20 sequence identical to that described in Hou, J. et al., Immunity 2, (1995) 321-329 (SEQ ID NO: 30)) was synthesized according to well known procedures as described in Rosen et al., Bio. Techniques 9, (1990) 298-300. The resulting DNA sequence of the coding strand of the gene is as follows:

25 TTGCTTGGATCCTGGACGACGACGGAC AAAATGGAAG TTCTGAAAAAA
ACACCACAAA CCGCACTGGA ACGACGGTGC TATCCTGGGT
TTCGTTAACCA TCACGACCTG CTGATCAACA AACCGGACGG
TACCTTCCTG CCGACTCCGA AATCGGTGGT ATCACCATCG
CTTGGAAATT GAACGTAACC TGTGGAACCT GAAACCGTTC
30 ACCACCCGTG CCGTTCCCTG GCTGACCGTC TGGGTGACCT
GTCCTACCTG TCCCGGACCG TCCGAAAGAC GAAGTTTCT

CCAAATACTA CACCCCGTAATAGTCTAGAACGAA (SEQ ID NO: 31)

Restriction sites for BamHI and XbaI are underlined in the sequence above.

The ek-Stat 5-SH2 gene sequence was digested with BamHI and XbaI,

5 followed by isolation of the digested fragment on an agarose gel. The fragment was ligated with the vector fragment derived from BamHI-XbaI digestion of the expression vector containing the tagged human src gene DET1-DET2-spacer-ek-src SH2 described in Procedure 2 above. In that vector, the BamHI site is located between the coding regions for DET2 and SH2, and the XbaI site is located after the
10 3' end of the SH2 coding region. The ligation reaction was used to transform E. coli MM294cI+. The construct DET1-DET2-spacer-ek-Stat 5 SH2 was confirmed by DNA sequencing (SEQ ID NO: 32) and induced in E. coli strain GI698 (Invitrogen Corporation, San Diego, CA). Induction of the phage lambda promoter was induced by addition of tryptophan to the culture medium to 10 mg/ml, per the manufacturer's
15 instructions, also as described in procedure 4. A Coomassie-Blue-stained, Western-blot-positive induced protein band with an apparent molecular weight of 15,000 was observed after tryptophan induction of cells growing at 27° C.

Cells were lysed at neutral pH by sonication in the presence of lysozyme.

After centrifugation, the soluble extract is chromatographed on a Ni⁺⁺NTA column.

20 After washing the column with equilibration buffer (Tris buffer pH 8 containing 0.5 M NaCl) and the same buffer containing 15 mM imidazole, the protein is eluted in highly purified form with 25 mM imidazole in equilibration buffer. This expressed fusion protein, DET1-DET2-spacer-ek-STAT 5 SH2, is utilized in the "Binding Assays" described below in order to determine the specificity of compounds to
25 selectively inhibit the human Stat 5 SH2 domain.

Fusion proteins having the structure GST-X-SH2 are prepared as described in the GST gene fusion kit system available from Pharmacia (New Jersey). GST is the tagging sequence glutathione s-transferase epitope (SEQ ID NO: 8) for fyn, Grb2 and SH-PTP2 and is the tagging sequence glutathione s-transferase epitope (SEQ ID NO: 9) for p85. SH2 refers to the SH2 domains of fyn, Grb2, p85 and SH-PTP2

which were expressed and purified using glutathione Sepharose 4B (Pharmacia) according to "Current Protocols in Molecular Biology", ed. FM Ausubel et al., pub. John Wiley and Sons, Inc., (1995), p 16.7.1. X is an appropriate linker, preferably of 6 to 21 base pairs, used to keep the SH2 construct in frame and complement cloning.

5 As such, the sequence of X is not critical. One skilled in the art can readily construct the appropriate linker. The DNA sequence encoding each GST-X-SH2 fusion protein was designed such that the indicated restriction sites (BamHI and EcoRI) flank the SH2 region. The vector used in the instant experiments was the E. coli expression vector pGEX-2T (Pharmacia) for fyn, Grb2 and SH-PTP2, and pGEX-3X (Pharmacia) for p85. Each of these vectors result in SH2 constructs having additional C-terminal amino acids as described below.

The sequence encoding the SH2 domain of human fyn (amino acids 143-252) (Yamamoto, T. et al. Proc. Natl. Acad. Sci. USA **83**, 5459-5463 (1986)) was cloned into the BamHI and EcoRI sites of the expression vector pGEX-2T. The 15 SH2 domain including the additional C-terminal amino acids leucine-threonine-asparagine-serine-serine (SEQ ID NO: 10) was cloned by PCR techniques known to those skilled in the art to yield the expressed fusion protein GST-X-fyn. This expressed fusion protein was then utilized in the "Binding Assays" described below in order to determine the specificity of compounds to selectively inhibit the human 20 fyn SH2 domain.

Human p85 SH2 domain: The sequence encoding the SH2 domain of human p85 (amino acids 321-440) (Skolnik, E. et al., Cell **65**, 83-90 (1991)) was cloned into the BamHI and EcoRI sites of the expression vector pGEX-3X. The SH2 domain including the additional C-terminal amino acids asparagine-serine-serine 25 (SEQ ID NO: 11) was cloned by PCR techniques known to those skilled in the art to yield the expressed fusion protein GST-X-p85. This expressed fusion protein was then utilized in the "Binding Assays" described below in order to determine the specificity of compounds to selectively inhibit the human p85 SH2 domain.

Human SH-PTP2 SH2 domain: The sequence encoding the SH2 domain of 30 human SH-PTP2 (amino acids 1-106)(Bastien, L. et al., Biochem. Biophys. Res. Commun. **196**, 124-133 (1993)) was cloned into the BamHI and EcoRI sites of the

expression vector pGEX-2T. The SH2 domain including the additional C-terminal amino acids glutamine-phenylalanine-isoleucine-valine-threonine-aspartate (SEQ ID NO: 12) was cloned by PCR techniques known to those skilled in the art to yield the expressed fusion protein GST-X-SH-PTP2. This expressed fusion protein was then 5 utilized in the "Binding Assays" described below in order to determine the specificity of compounds to selectively inhibit the human SH-PTP2 SH2 domain.

Human Grb2 SH2 domain: The sequence encoding the SH2 domain of human Grb2 (amino acids 58-159) (Lowenstein, E. et al., *Cell* 70, 431-442 (1992)) was cloned into the BamHI and EcoRI sites of the expression vector pGEX-2T. The 10 SH2 domain including the additional C-terminal amino acids isoleucine-histidine-arginine-aspartate (SEQ ID NO: 25) was cloned by PCR techniques known to those skilled in the art to yield the expressed fusion protein GST-X-Grb2. A six nucleotide linker was used and resulted in the amino acids glycine and serine between the GST and SH2 domain. This expressed fusion protein was then utilized 15 in the "Binding Assays" described below in order to determine the specificity of compounds to selectively inhibit the human Grb2 SH2 domain.

Binding Assays: The potency of compounds at the SH2 domains is determined based on the ability of such compounds to selectively inhibit such SH2 domain from 20 binding to its respective specific pY peptide.

The binding assays for the SH2 domains and pY peptides are performed in an ELISA-based 96 well plate assay. In Millipore 96 well filter plates, hydrophilic Durapore® (pore size 0.65um Cat. No. MADVN6550), are added 2 ul (50% suspension) of Protein-G Sepharose (available from Pharmacia of N.J. Cat. No. 17-25 0618-01) and either 2 ul of 2 mg/ml of MAB178.1 (for gp120/SI2 domain fusion proteins src, lck, Stat 5, Stat 6 and hcp) or 0.25 ul of anti-GST polyclonal antisera (available from Pharmacia of N.J.) (for GST/SI2 domain fusion proteins fyn, Grb2, p85 and SH-PTP2). 10 pmol of the subject SH2 domain fusion protein are added to their respective wells. The volume is brought to 100 ul with TBS-T (tris buffered 30 saline plus 0.05% tween-20), incubated and shaken at room temperature for 1 hr. then washed 1x with TBS-T (4°C). 90 ul of TBS-T is then added to each well.

Specific pY biotinylated peptides are diluted to a concentration of 1.0 uM in TBS-T (these peptides can be obtained from Bachem Bioscience of Pennsylvania, Genosys Biotechnologies of Texas and California Peptide Research of California). 10 ul is aliquoted per well to yield a final concentration of 0.1 uM (approx. the K_d for each SH2 domain/peptide pair) and a final volume of 100 ul. The assay plates are incubated until equilibrium binding was attained (3 hr at 4°C with shaking). The assay plates are washed 2 X per well TBS-T (4°C), then 100 ul of SABC (Streptavidin biotinylated horseradish peroxidase complex, available from the Zymed corporation of California cat. no. 93-0043, 1 drop reagent A (streptavidin) and 1 drop of reagent B (AH-biotin conjugated-horseradish peroxidase) per 10 ml of TBS-T, incubated at 37°C for 30 minutes, then cooled to 4°C) is added per well, then incubated at 4°C for 30-60 minutes. The plates are then washed 4 X with TBS-T (4°C) (250 ul/well)/wash). 100 ul of 1 mg/ml OPD (o-phenyldiamine, Sigma Chemical Corporation, St. Louis Missouri) in Citrate Buffer is added per well. To stop development, 100 ul of 10% sulfuric acid is added per well. 150 ul from each well is then removed from the assay plate and placed in an ELISA plate. The A₄₉₀ of each ELISA plate is then determined.

Determination of (IC₅₀) for Table I

Each control or compound is assayed in duplicate. The duplicates are averaged and the background subtracted and the maximal values with no inhibition are taken from the plate, then all other data points are expressed as a percent of the maximal value (or as % control). These % control data values are graphed in Kaleidagraph for Macintosh (Synergy Software). The curves on these graphs are nonlinear curve fitted with the following equation F(x)=Emax/(1+(k_d/conc)^{slope}), wherein the k_d term represents the IC₅₀ for each of the curves.

Determination of (Ki) for Table II

The Ki for respective compounds is calculated via the following equation (see below). This expanded equation must be used under the conditions of this assay, due to the fact that the pY biotinylated peptide is not in vast excess concentration (100X) over the SH2 domain fusion protein. The IC₅₀ is an extrapolated value from a nonlinear curve fit using Kaleidagraph. R_{tot} and *D are

known values for reagents input into the assay. KD generally must be experimentally determined for each combination of SH2 domain fusion protein and pY biotinylated peptide.

5 KI=(IC₅₀-

Rtot+Rtot/2((*D/(KD+*D))+(KD/(KD+*D+Rtot/2)))/(1+*D/KD+Rtot/KD((KD+*D
/2)/(KD+*D)))

KI=(uM)KDof competitor

10 IC₅₀=(uM) IC₅₀ for inhibitor, derived via nonlinear curve fit of competition selectivity assay data for each SH2 domain

Rtot=(uM)total SH2 domain concentration within 1 assay (microtitre plate) well

*D=(uM)concentration of specific pY and biotinylated peptide for each SH2 domain

KD=(uM)KD value for the specific pY and biotinylated peptide for each SH2

15 domain

IC₅₀ is the concentration of inhibitor at which the response or signal is inhibited by 50%

20 KD is the dissociation constant for a ligand in a receptor/ligand interaction, normally equaling the concentration of ligand which is at 1/2 V_{max} on a saturation binding curve>

The pY peptide ligands used in the above Binding Assays are as follows:

25 Biotinylated pY peptide ligand containing an aminocaproic acid (Aca) linker used for src, lck, and fyn SH2 domains

Glu-Pro-Gln-pTyr-Glu-Glu-Ile-Pro-Ile-Tyr-Leu (SEQ ID NO: 13)

30 Biotinylated pY peptide ligand containing an aminocaproic acid (Aca) linker used for p85 SH2

Asp-Gly-Gly-pTyr-Met-Asp-Met-Ser-Lys-Asp-Glu (SEQ ID NO: 14)

5 Biotinylated pY peptide ligand containing an aminocaproic acid (Aca) linker used
for SH-PTP2 SH2

Glu-Asn-Gly-Leu-Asn-pTyr-Ile-Asp-Leu-Asp-Leu (SEQ ID NO: 15)

10 Biotinylated pY peptide ligand containing an aminocaproic acid (Aca) linker used
for hcp SH2

Thr-Pro-Pro-His-Leu-Lys-pTyr-Phe-Tyr-Phe-Val-Val-Ser-Asp-Ser-Gly (SEQ ID
NO: 16)

15 Biotinylated pY peptide ligand containing an aminocaproic acid (Aca) linker used
for Grb2 SH2

Leu-Pro-Val-Pro-Glu-pTyr-Ile-Asn-Gln-Ser-Val (SEQ ID NO: 26)

20 Biotinylated pY peptide ligand containing an aminocaproic acid (Aca) linker used
for Stat 6:

Ser-Gly-Glu-Glu-Gly-pTyr-Lys-Pro-Phe-Gln-Asp-Leu-Ile (SEQ ID NO: 33)

25 Biotinylated pY peptide ligand containing an aminocaproic acid (Aca) linker used
for Stat 5:

Ala-Val-Asp-Gly-pTyr-Val-Lys-Pro-Gln-Ile-Lys (SEQ ID NO: 34)

30 Results of Binding Assays:

Tables I and II illustrate the cross reactivity of SH2 antagonists at the indicated SH2

domains. From the results disclosed in these tables compounds which have binding affinities/inhibitory concentrations which are greater than fifty-fold higher at the Stat 6 SH2 domain than the binding affinities/inhibitory concentrations at other SH2 domains can be readily identified.

What is claimed is:

1. A method of treating allergic reactions in a subject which comprises administering to the subject a therapeutically effective amount of a compound
5 which:
 - a. binds to a human Stat 6 SH2 domain with a binding affinity which is greater than fifty-fold higher than the binding affinity with which the compound binds to a human Stat 5 SH2 domain;
 - b. binds to a human hcp SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;
 - c. binds to a human SH-PTP2 SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;
 - d. binds to a human p85 SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;
 - e. binds to a human Grb2 SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;
 - f. binds to a human src SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;
 - g. binds to a human lck SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain; and
 - h. binds to a human fyn SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain.
2. The method of claim 1 which comprises administering to the subject

30

a therapeutically effective amount of a compound which binds to a human Stat 6 SH2 domain with a binding affinity which is greater than fifty-fold higher than the binding affinity with which the compound binds to a human Stat 5 SH2 domain.

5 3. The method of claim 1 which comprises administering to the subject a therapeutically effective amount of a compound which:

- a. binds to a human Stat 6 SH2 domain with a binding affinity which is greater than one hundred-fold higher than the binding affinity with which the compound binds to a human Stat 5 SH2 domain;
- 10 b. binds to a human hcp SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;
- c. binds to a human SH-PTP2 SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;
- 15 d. binds to a human p85 SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;
- e. binds to a human Grb2 SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;
- 20 f. binds to a human src SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;
- g. binds to a human lck SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain; and
- 25 h. binds to a human fyn SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain.

4. The method of claim 3 which comprises administering to the subject a therapeutically effective amount of a compound which binds to a human Stat 6 SH2 domain with a binding affinity which is greater than one hundred-fold higher than the binding affinity with which the compound binds to a human Stat 5 SH2 domain.

5

5. A method of treating asthma in a subject which comprises administering to the subject a therapeutically effective amount of a compound which:

10 a. binds to a human Stat 6 SH2 domain with a binding affinity which is greater than fifty-fold higher than the binding affinity with which the compound binds to a human Stat 5 SH2 domain;

b. binds to a human hcp SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound
15 binds to such Stat 6 SH2 domain;

c. binds to a human SH-PTP2 SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;

d. binds to a human p85 SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound
20 binds to such Stat 6 SH2 domain;

e. binds to a human Grb2 SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;

f. binds to a human src SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound
25 binds to such Stat 6 SH2 domain;

g. binds to a human lck SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound
30 binds to such Stat 6 SH2 domain; and

h. binds to a human fyn SH2 domain with a binding affinity which is

greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain.

6. The method of claim 5 which comprises administering to the subject
5 a therapeutically effective amount of a compound which binds to a human Stat 6 SH2 domain with a binding affinity which is greater than fifty-fold higher than the binding affinity with which the compound binds to a human Stat 5 SH2 domain.

7. The method of claim 5 which comprises administering to the subject
10 a therapeutically effective amount of a compound which:

a. binds to a human Stat 6 SH2 domain with a binding affinity which is greater than one hundred-fold higher than the binding affinity with which the compound binds to a human Stat 5 SH2 domain;

15 b. binds to a human hcp SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;

c. binds to a human SH-PTP2 SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;

20 d. binds to a human p85 SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;

e. binds to a human Grb2 SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the

25 compound binds to such Stat 6 SH2 domain;

f. binds to a human src SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;

30 g. binds to a human lck SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain; and

h. binds to a human fyn SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain.

5 8. The method of claim 7 which comprises administering to the subject a therapeutically effective amount of a compound which binds to a human Stat 6 SH2 domain with a binding affinity which is greater than one hundred-fold higher than the binding affinity with which the compound binds to a human Stat 5 SH2 domain.

10 9. A method of treating allergic rhinitis in a subject which comprises administering to the subject a therapeutically effective amount of a compound which:

15 a. binds to a human Stat 6 SH2 domain with a binding affinity which is greater than fifty-fold higher than the binding affinity with which the compound binds to a human Stat 5 SH2 domain;

b. binds to a human hcp SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;

20 c. binds to a human SH-PTP2 SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;

d. binds to a human p85 SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;

25 e. binds to a human Grb2 SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;

30 f. binds to a human src SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;

- g. binds to a human lck SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain; and
- 5 h. binds to a human fyn SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain.

10. The method of claim 9 which comprises administering to the subject a therapeutically effective amount of a compound which binds to a human Stat 6
10 Stat 6 SH2 domain with a binding affinity which is greater than fifty-fold higher than the binding affinity with which the compound binds to a human Stat 5 SH2 domain.

11. The method of claim 9 which comprises administering to the subject a therapeutically effective amount of a compound which:

- 15 a. binds to a human Stat 6 SH2 domain with a binding affinity which is greater than one hundred-fold higher than the binding affinity with which the compound binds to a human Stat 5 SH2 domain;
- b. binds to a human hcp SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;
- 20 c. binds to a human SH-PTP2 SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;
- d. binds to a human p85 SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;
- 25 e. binds to a human Grb2 SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;
- f. binds to a human src SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the

compound binds to such Stat 6 SH2 domain;

g. binds to a human lck SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain; and

5 h. binds to a human fyn SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain.

10 12. The method of claim 11 which comprises administering to the subject a therapeutically effective amount of a compound which binds to a human Stat 6 SH2 domain with a binding affinity which is greater than one hundred-fold higher than the binding affinity with which the compound binds to a human Stat 5 SH2 domain.

15 13. Use of a compound which:

a. binds to a human Stat 6 SH2 domain with a binding affinity which is greater than fifty-fold higher than the binding affinity with which the compound binds to a human Stat 5 SH2 domain;

20 b. binds to a human hcp SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;

c. binds to a human SH-PTP2 SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;

25 d. binds to a human p85 SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;

e. binds to a human Grb2 SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;

30 f. binds to a human src SH2 domain with a binding affinity which is

greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;

g. binds to a human lck SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain; and

5 h. binds to a human fyn SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain; in the manufacture of a medicament for use in treating allergic reactions.

10

14. A use according to claim 13 wherein the compound binds to a human Stat 6 SH2 domain with a binding affinity which is greater than fifty-fold higher than the binding affinity with which the compound binds to a human Stat 5 SH2 domain.

15

15. A use according to claim 13 wherein the compound:

a. binds to a human Stat 6 SH2 domain with a binding affinity which is greater than one hundred-fold higher than the binding affinity with which the compound binds to a human Stat 5 SH2 domain;

20 b. binds to a human hcp SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;

c. binds to a human SH-PTP2 SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;

25 d. binds to a human p85 SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;

e. binds to a human Grb2 SH2 domain with a binding affinity which is

30 greater than one hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;

f. binds to a human src SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;

5 g. binds to a human lck SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain; and

10 h. binds to a human fyn SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain.

10

16. A use according to claim 15 wherein the compound binds to a human Stat 6 SH2 domain with a binding affinity which is greater than one hundred-fold higher than the binding affinity with which the compound binds to a human Stat 5 SH2 domain.

15

17. Use of a compound which:

a. binds to a human Stat 6 SH2 domain with a binding affinity which is greater than fifty-fold higher than the binding affinity with which the compound binds to a human Stat 5 SH2 domain;

20 b. binds to a human hcp SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;

c. binds to a human SH-PTP2 SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the

25 compound binds to such Stat 6 SH2 domain;

d. binds to a human p85 SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;

30 e. binds to a human Grb2 SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;

- f. binds to a human src SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;
- 5 g. binds to a human lck SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain; and
- 10 h. binds to a human fyn SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain; in the manufacture of a medicament for use in treating asthma.

18. A use according to claim 17 wherein the compound binds to a human Stat 6 SH2 domain with a binding affinity which is greater than fifty-fold higher than the binding affinity with which the compound binds to a human Stat 5 SH2 domain.

19. A use according to claim 17 wherein the compound:

- a. binds to a human Stat 6 SH2 domain with a binding affinity which is greater than one hundred-fold higher than the binding affinity with which the compound binds to a human Stat 5 SH2 domain;
- 20 b. binds to a human hcp SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;
- c. binds to a human SH-PTP2 SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;
- 25 d. binds to a human p85 SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;
- e. binds to a human Grb2 SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the

compound binds to such Stat 6 SH2 domain;

f. binds to a human src SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;

5 g. binds to a human lck SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain; and

10 h. binds to a human fyn SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain.

20. A use according to claim 19 wherein the compound binds to a human Stat 6 SH2 domain with a binding affinity which is greater than one hundred-fold higher than the binding affinity with which the compound binds to a human Stat 5
15 SH2 domain.

21. Use of a compound which:

a. binds to a human Stat 6 SH2 domain with a binding affinity which is greater than fifty-fold higher than the binding affinity with which the compound

20 binds to a human Stat 5 SH2 domain;

b. binds to a human hcp SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;

c. binds to a human SH-PTP2 SH2 domain with a binding affinity
25 which is greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;

d. binds to a human p85 SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;

30 e. binds to a human Grb2 SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound

binds to such Stat 6 SH2 domain;

f. binds to a human src SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;

5 g. binds to a human lck SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain; and

10 h. binds to a human fyn SH2 domain with a binding affinity which is greater than fifty-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain; in the manufacture of a medicament for use in treating allergic rhinitis.

22. A use according to claim 21 wherein the compound binds to a human Stat 6 SH2 domain with a binding affinity which is greater than fifty-fold higher than the binding affinity with which the compound binds to a human Stat 5 SH2 domain.

23. A use according to claim 21 wherein the compound:

20 a. binds to a human Stat 6 SH2 domain with a binding affinity which is greater than one hundred-fold higher than the binding affinity with which the compound binds to a human Stat 5 SH2 domain;

b. binds to a human hcp SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;

25 c. binds to a human SH-PTP2 SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;

d. binds to a human p85 SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;

30 e. binds to a human Grb2 SH2 domain with a binding affinity which is

greater than one hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;

- f. binds to a human src SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain;
- 5 g. binds to a human lck SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain; and
- h. binds to a human fyn SH2 domain with a binding affinity which is greater than one hundred-fold lower than the binding affinity with which the compound binds to such Stat 6 SH2 domain.

- 10 24. A use according to claim 23 wherein the compound binds to a human Stat 6 SH2 domain with a binding affinity which is greater than one hundred-fold higher than the binding affinity with which the compound binds to a human Stat 5 SH2 domain.

INTERNATIONAL SEARCH REPORT

International application No.
PCT/US96/11074

A. CLASSIFICATION OF SUBJECT MATTER

IPC(6) :A61K 31/00; G01N 33/53
US CL :514/1; 435/7.1; 436/501

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

U.S. : 514/1; 435/7.1; 436/501

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

STN, APS

search terms: sh2, src homology 2, allergy, asthma, rhinitis

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
A	WO 94/07913 A1 (WARNER-LAMBERT COMPANY) 14 April 1994, see pages 1-9.	1-24
A	US 5,352,660 A (PAWSON) 04 October 1994, see column 3, line 32-column 5, line 30 and claim 9.	1-24
A	BURKE, JR. et al. 4'-O-[2-(2-Fluoromalonyl)]-L-tyrosine: A Phosphotyrosyl Mimic for the Preparation of Signal Transduction Inhibitory Peptides. Journal of Medicinal Chemistry, 1996, Vol. 39, No. 5, pages 1021-1027, see abstract.	1-24

Further documents are listed in the continuation of Box C.

See patent family annex.

- * Special categories of cited documents:
- "A" document defining the general state of the art which is not considered to be of particular relevance
- "E" earlier document published on or after the international filing date
- "L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- "O" document referring to an oral disclosure, use, exhibition or other means
- "P" document published prior to the international filing date but later than the priority date claimed
- "T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
- "X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
- "Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art
- "&" document member of the same patent family
